Sorry for not talking about belly button fluff. I'll try and concentrate on the focus of this group. :-(At least we were making friends and having a fun discussion. But yes it was way off topic. My bad.

Now that I have my license I'll be trying out chirp. Although the few repeaters I would use I already programmed in via the keyboard. It takes a little time but once in your done.

Is there anything else I can do that chirp would be better at other than speed and ease of use?

If you were you would know what a load that 75% working at home is. Not even 5%. Just think about it. 8 hours work, 8 hours working at home and 8 hours sleep. Add it up. What are they grading, what great lesson plans are they creating. Why is their no results from this herculean effort? Why are school failing at an alarming rate? Once you had a lesson plan why would you need to spend time on it. Even tweaking it would only require very minimal (minutes) time.

Paul,

With CHIRP you can . . .

- give your channels 7-character text names
- program channels to be skipped when scanning
- set the band limits so that the VFO can only select frequencies in the
ham bands (you will still be able to program and use frequencies out of
that range using software
- TX inhibit channels that you never, ever want to accidentally transmit on
- edit the power-on message
- edit the 6+power-on message

The radio came in the mail today.

Programming it on the keypad is a major pain, but is do-able.

It appears that CHIRP doesn’t work on 64-bit Windows 7. It doesn’t see the radio. Moving over to an old 32-bit XP system, it appears to work well enough. (Trying to resize the window seems to hang it hard.)

The XP system is probably not completely up-to-date, so there may be other issues going on.

I was able to set up three local 2M repeaters from the keypad.

CHIRP works just fine on Win 7 64 bit. It's all about having the right driver. Check the www.miklor.com web site.

I keep seeing talk about CHIRP (what is this) also why is it important to be able to program a radio? Can't all its functions be accessed just be using the hand set itself?

Why on earthg would I need to programme a radio? Whats the advantages of this?

Without programming a radio, either manually or with software, there is no information in the radio as to what frequencies you are using or having any ability to use the radio for anything but a paperweight. TVs and broadcast AM/FM Radios are used by changing channels already "programmed"ahead of time. You can enter your freqs manually, including offset, tones, etc, every time you want to talk to someone, or use software like CHIRP to make it easier to use, like telling your tv what your favorite tv stations are ahead of time and bypassing all the other channels you don't want to watch. You have to tell the radio something, or it useless. Even FRS/GMRS Radios are preprogrammed with the freqs they are authorized to use. These radios are not preset, someone needs to tell them how YOU want to use them. Everybody will set their radios up differently.

No. Here is a short list of things you can not do from the keypad.

- Set a channel to skip when scanning
- Set a channel to inhibit TX
- Edit channel names
- Edit power on message
- Edit the band limits
- Edit the ANI code
- Edit the PTT-IDs

Does the software do anything extra ? Or can it be programmed just as good from the handset itself ? And how do you know what frequnies you want to input for you respective area? Do you need a scanner to find frequencies in your area?

It just confuses me that people are always commenting on programming via the computer but I really don't see what the big advantage is at all

Yes, I do know some teachers. My sister-in-law has been teaching in Wisconsin public schools for decades, And most of what you say is completely incorrect, at least as far teaching in rural WI schools. Virginia (my sister in law) works a lot harder than most other people I know, and spends a lot of her personal time at home grading papers and designing new projects, and spends her own money to buy classroom supplies because the school districts are too cheap to supply the material they need.

I don't doubt that in some parts of the country your observations are correct; please be careful, though, about applying your opinions with too broad a brush.

First, to determine what frequencies to program in to your radio, do a Google search for repeaters in your area.

Second, while you can certainly set up repeater input and output frequencies and PL tones manually, doing so with the menus on these tiny Chinese radios is a massive PITA. I wholeheartedly recommend picking up a programming cable and using Chirp to set up your rig.

And I'm not saying this as a lazy appliance operator. I earned my first ham license in 1970, upgraded to Extra in 1973 (back when you still had to do 20 WPM Morse to pass), and got my B. Sc degree in electrical engineering in 1979. Even so, I got so frustrated I nearly ended up throwing my UV-5R out the window after futzing with those damned menus.

“Programming the radio” basically means setting channel frequencies, transmit offsets, PL tones, and saving the results to a preset channel. The days when you had six crystal sockets inside the radio and a +600/simplex/-600 slide switch on top of it are LOOOOOONG gone.

As the other guy points out, there are some thing you can’t do from the UV-5R keypad. The things you can do take a lot of keystrokes, that have to be done in the right order.

Come on, guys. This is so far off topic, it's ridiculous.
Let's get back to the UV-5R.

Just in case the question comes up again; I never did find a functional USB driver for Windows XP 64-bit. I ended up with a serial cable that works well and use the USB cable with the NetBook.

Thanks for the comeback.

It turns out that CHIRP on Windoze 7 64-bit requires a very specific version of the Prolific (?) USB-to-serial driver. The Miklor site has the links, and a VERY well-written procedure for loading it. Once I loaded the correct driver, it worked apparently perfectly: it saw the radio, and pulled the presets in easily.

There are a lot of resources to find repeaters in your area. Ham radio clubs, Google, other hams, etc. i think there are a few advantages of using software vs hand programming, the FAQs link found at the end of each email should point most of them out. Speed is the biggest advantage. I do believe everyone should still knowhow to do it manually, though. In an emergency, you might not have access to your computer, and why use the computer to make a simple change? I do know several people on my ARES team that don't know how to do it without the computer, and they are "emergency communicators".

I have Windows 64 and have installed the free to download Microsoft virtual PC XP machine. In other words a Win XP computer installed in virtualization software.

What this does is allow you to run ANY XP software in XP on your Windows 7 computer. You would open the virtual XP, install the software on it and copy the start link to your Windows 7 computer and close the virtual XP computer. Then when you start the program from your new shortcut it will open and run just like any other program except it will be running from the virtual XP environment.

Its the ultimate best of both worlds. It is not the standard Microsoft virtual PC software. It is a specially made XP virtual PC from Microsoft and its free to download. Just Google or search Microsoft's web site to find the download and installation instructions.

Try Milwaukee Wisconsin. That's where they have double pensions. Her spend time at home sounds like she just likes to create things. Certainly there is time in a day to do these things. But instead of staying at the school to do them I suspect she goes home and does it there big Whoopie. A few nights she takes work home. Teachers are not the only ones to do this. Welcome to the working world.

Yeah I wish I lived in your neck of the woods. The public schools here in Wisconsin have a very lax grading system they use to grade themselves. Guess which school district failed that very lax test? ... wait for it ... the Milwaukee public school system! All the big cities are the same. Oh and the Milwaukee Public School System has just announced they will non longer use letter grades. Just a pass fail. Great way to hide their incompetence.

If you want the skinny on Wisconsin listen to the Mark Belling talk show. You can listen online or download the podcast if you're not in his coverage area. I live in Milwaukee, grew up near here. When i went to school in the suburbs the schools were pretty good. Milwaukee was not as good but still not all that bad. Now its so bad I paid to send my kids to private schools. Then we got the voucher program which save a lot of money. The private schools only use a portion of the voucher as they can do a much better job for much less. Throwing money at a problem is not always a solution. In fact throwing money around can make things much worse.

Now if you want to continue this please contact me directly off group so we don't clog up the list with off topic discussions. I used to live in California, I miss it. Especially the weather. It was going bad years ago when I left and has gotten much worse since. I have a couple of brothers still living there. One will be retiring soon to another state. Sad to see the great state of California bled to death by clueless politicians. Things are not looking good for the country.

>
>
>Full time pay for a job that gives you off holidays, snow days, the summer and they even throw in vacation and generous sick days. Add to that generous insurance, pensions, cadillac insurance and other benefits. Where in the real world would you find even half that. I am in a powerful union and even I don't get anything close. Here in my city the teachers get two (2) pensions! Oh those poor poor teachers... NOT.
>
>
>If they are doing work at home its because they are wasting their time at work. Yeah I bet they are grading papers at home til their little fingers bleed. If you believe that I have a bridge to sell you.
>
>
>Do you actually know any teachers? Are you familiar with their schedule outside of work? That is a rhetorical question, No you do not. If you were you would know what a load that 75% working at home is. Not even 5%. Just think about it. 8 hours work, 8 hours working at home and 8 hours sleep. Add it up. What are they grading, what great lesson plans are they creating. Why is their no results from this herculean effort? Why are school failing at an alarming rate? Once you had a lesson plan why would you need to spend time on it. Even tweaking it would only require very minimal (minutes) time.

34646. NEW DISCOVERY!!! USING THE BAOFENG UV5R AS A DIRECT REPEATER- TRIGGER GND PTT!!!

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-01 17:04:15 UTC
From: mikemccsolutions
Topic: 34646 Message: 34646

HEY GUYS JUST WANTED TO PUT THE WORD OUT!!!!

I have a Motorola MaraTrac that I wanted to use a repeater setup but I coundnt find another one so I decided to go on a lemb and take apart my Baofeng UV-5RT to see if I could trigger PTT of the MaraTrac some how. I knew it was a long shot but I got luckey!!! This method will trigger PTT for almost any Radio and you dont have to buy anything extra!!! THIS WILL BLOW THE REPEATER GUYS AWAY!!!

Its basically a Linear Repeater with the Baofeng as the Receiver and any other radio as the Transmitter, im my case a MaxTrac 100watts!!!

When you take apart the Baofeng UV-5R there are many test points(The Copper Circle Dots). Two of them are on the very left edge and they are named "AF" and "IN". All I did was connect my PTT wire(The one you ground for PTT) and Solder it to the one labeld "AF". Then Ground your Radio to the body of the Baofeng(In my case I used the screw). Then just connect your Speaker POS+ from the Baofeng to the MIC+ of the TX Radio!

And Wallah!!!! It works Great! Triggers PTT Every time with no delay!!!

I made some optional inprovement that are inexpencive, I actually used parts from a old bad power supply.

-I connected a POT(Pointimeter) to the AF and the PTT in case I needed to make adjustments.

-I connected the audio strait to the Speaker instead of the Headphone jack. In my case I removed the stock speaker and connected the POS to the MIC of the TX Radio and to soften the noise I connected the NEG of the speaker as well with a 25v 10uf Capacitor in between.

-I also removed the stock VOL/ON Switch and soldered a simple switch and a POT(Pointimeter)for the Volume. But this is not necessary!

This method is great, if you are using a high powered TX radio 25watt or higher I suggest separating the RX Baofeng from the TX Radio by at least 10ft because they tend to pick up interference and go crazy on you! I have mine like 25foot away and it still works fine, you just have to have three long wires!

I hope this helps some one save time and money like it did me! If have any questions feel free to contact me, I would have taken pictures but I was kinda caught up in the moment lol

Re: programming the radio. As noted there are functions you can not do from the front panel which are desirable. HOWEVER, with a little instruction one can EASILY and QUICKLY program the Baofengs from the keypad both as simplex and repeater radios with little issue, minus the functions noted.

At a recent ARES meeting, we held a drill where members broke up into groups by manufacture of the radio they possessed (Icom, Yaesu, Kenwood & Baofeng). Then at points in the meeting we were instructed to program the radio to a simplex frequency given and provide a test transmission with your call. The Baofeng members were on channel first. The last place folks were the Yaesu owners who had a heck of a time figuring out how to program their radio. I also have an Icom IC-W31A which someone provided me which was a bugger to figure out the first time I went at it.

Each radio has it's own programming functions and each has to be trained on the approach and eccentricities involved. There are some great videos on youtube demonstrating how to program all these radios which can be very helpful in learning your radio.

It is impossible to set the text tags for the channels. If you are happy remembering frequencies you can do it manually. Most of us prefer a name of the channel.

We regret the disruption, but during the Federal Government-wide shutdown, the FCC is limited to performing duties that are immediately necessary for the safety of life or the protection of property. FCC online systems will not be available until further notice.

http://www.fcc.gov/Plan-for-Orderly-Shutdown-September-2013.pdf

Suspended activities include, among many others: Consumer complaint and inquiry phone lines cannot be answered;
consumer protection and local competition enforcement must cease; licensing services,
including broadcast, wireless, and wireline, must cease; management of radio spectrum
and the creation of new opportunities for competitive technologies and servicesfor the
American public must be suspended; and equipment authorizations, including those bringing new electronic devices to American consumers, cannot be provided.

I haven't actually operated on the IRLP network yet. See <http://www.irlp.net/> for information about The Internet Radio Linking Project. I just learned that there are ongoing topical discussions as well as geographically-focused ones. The Baofeng UV-5RE should work fine for IRLP as long as an operator can access a node. To find out what local nodes are in your vicinity, enter your zip code at <http://status.irlp.net/index.php?PSTART=7>, specifying distance units and radius and click Submit.

Shall we give this a try? Please tell us how IRLP is working for you.

Thanks and 73,
Bruce Prior N7RR

So what frequencies/band(s) are setting this up on? What are you doing for isolation between them? Will this setup be using the normal repeater frequency pairing?

I think Alex meant 75% of their time grading is at home. Little time to do it during the day.

Double pension? That's a new concept to me. I was hoping it wasn't some one counting the money a teacher puts into the system as one and the state contribution as the "other". In my state was the teacher contributes part and the state contributes the rest. Unfortunately, for the previous twenty years teachers put in every year but my state only put in money for 7 of those years and not fully for many of them. The money went "elsewhere". One governor borrowed $12M and never put it back. When he got elected, the present governor started bellyaching about the pension being too high and costing too much tax money and the rest of the yahoos joined in. Little do they know.

I work in a "magnet" school so we can choose our students, just like private, religious and charter schools. We do well for an urban district. (100% acceptance to college, no name schools like Harvard, MIT, Yale, military academies, etc. and they get degrees too.) It's not a level playing field when doing comparisons.

And to respond to "if it's so bad, why not get another job..", I am retiring and probably will. There will be less people becoming teachers, especially in math and science. This has always been a problem. It will get worse and will take about ten years before the effect will be felt. Then it might be too late. If my job is so easy, why aren't YOU doing it?

I think Alex meant 75% of their time grading is at home. Little time to do it during the day.

Double pension? That's a new concept to me. I was hoping it wasn't some one counting the money a teacher puts into the system as one and the state contribution as the "other". In my state was the teacher contributes part and the state contributes the rest. Unfortunately, for the previous twenty years teachers put in every year but my state only put in money for 7 of those years and not fully for many of them. The money went "elsewhere". One governor borrowed $12M and never put it back. When he got elected, the present governor started bellyaching about the pension being too high and costing too much tax money and the rest of the yahoos joined in. Little do they know.

I work in a "magnet" school so we can choose our students, just like private, religious and charter schools. We do well for an urban district. Yeah I wish I lived in your neck of the woods. The public schools here in Wisconsin have a very lax grading system they use to grade themselves. Guess which school district failed that very lax test? ... wait for it ... the Milwaukee public school system! All the big cities are the same. Oh and the Milwaukee Public School System has just announced they will non longer use letter grades. Just a pass fail. Great way to hide their incompetence.

If you want the skinny on Wisconsin listen to the Mark Belling talk show. You can listen online or download the podcast if you're not in his coverage area. I live in Milwaukee, grew up near here. When i went to school in the suburbs the schools were pretty good.

Milwaukee was not as good but still not all that bad. Now its so bad I paid to send my kids to private schools. Then we got the voucher program which save a lot of money. The private schools only use a portion of the voucher as they can do a much better job for much less. Throwing money at a problem is not always a solution. In fact throwing money around can make things much worse.

Now if you want to continue this please contact me directly off group so we don't clog up the list with off topic discussions. I used to live in California, I miss it. Especially the weather. It was going bad years ago when I left and has gotten much worse since. I have a couple of brothers still living there. One will be retiring soon to another state. Sad to see the great state of California bled to death by clueless politicians. Things are not looking good for the country.

34657. Re: NEW DISCOVERY!!! USING THE BAOFENG UV5R AS A DIRECT REPEATER- TRIGGER GND PTT!!!

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-01 23:23:48 UTC
From: mikemccsolutions
Topic: 34646 Message: 34657

I did multiple channels and alternates like talk around but here is my main setup:

Baofeng Receiver:

RX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)
TX: Same but doesn't matter

Motorola Transmitter:

TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

Handsets: Motorola HT1250's and HT750's

Channel 1 Main:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)

Channel 2 Talk Around:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

I Have a total of 6 Channels Programmed on the Handheld Radios, 16 Channels on the Motorola MaraTrac(TX), and currently I Haven't reprogrammed the Baofeng(RX) to show channels and names but I have manually put in the settings. And Im using separate antennas so Im not using a Duplexer.

Let me ask why aren't you doing my job? Oh it must be because its so hard. What fallacious argument.

That is two (2) pensions fully paid for by the tax payers. Everywhere else you would fully fund it your self or possibly a small contribution from your employer. Most jobs have no pension. Consider yourself Lucky.

The schools here and many other places have been consuming money at an ever increasing rate while doing worse at teaching as each year passes. There is no comparison between failing public schools and high achieving private schools. Here in Milwaukee we have a private school who takes the worst kids, the one the public school claims they are stuck with. Not only do they educate those same miscreants they also manage to graduate them and send most on to college. And by the way they do this at a fraction of the cost! Yeah no comparison. Public school are failing and it has nothing to do with money. Also the Milw public school system refuses to sell one of its abandoned school building to this particular private school. I suppose MPS whats to keep the kids in failing schools because they "care" about the kids. Care is the last thing on the mind of MPS & unions. Pay and benefits not seen in the private sector much more so.

Topic: 34651 Message: 34665

Cool stuff, my zip is 98391, I am listening to 441625 which is 15-16 miles or so away.
 Will get coordinates tomorrow and get a better guage of true distance.

Hoping to get studying (paypal or send you a check this week)

Thank you for the irlp info, I will need to learn more about it.

Brian

Subject: [baofeng_uv5r] IRLP - The Internet Radio Linking Project

I haven't actually operated on the IRLP network yet. See <http://www.irlp.net/> for information about The Internet Radio Linking Project. I just learned that there are ongoing topical discussions as well as geographically-focused ones. The Baofeng UV-5RE should work fine for IRLP as long as an operator can access a node. To find out what local nodes are in your vicinity, enter your zip code at <http://status.irlp.net/index.php?PSTART=7>, specifying distance units and radius and click Submit.

Shall we give this a try? Please tell us how IRLP is working for you.

Thanks and 73,
Bruce Prior N7RR

Not sure I want to wade into this, but I have re-titled the
subject field so anyone can delete without reading. That said,
what is missing from the equation is PARENTS. I just do not see
how teachers alone can be held responsible for student performance
without including PARENT performance and participance.

wrote:

Try Milwaukee Wisconsin. That's where they have double pensions.
Her spend time at home sounds like she just likes to create
things. Certainly there is time in a day to do these things. But
instead of staying at the school to do them I suspect she goes
home and does it there big Whoopie. A few nights she takes work
home. Teachers are not the only ones to do this. Welcome to the
working world.

Yeah I wish I lived in your neck of the woods. The public schools
here in Wisconsin have a very lax grading system they use to grade
themselves. Guess which school district failed that very lax test?
... wait for it ... the Milwaukee public school system! All the
big cities are the same. Oh and the Milwaukee Public School System
has just announced they will non longer use letter grades. Just a
pass fail. Great way to hide their incompetence.

If you want the skinny on Wisconsin listen to the Mark Belling
talk show. You can listen online or download the podcast if you're
not in his coverage area. I live in Milwaukee, grew up near here.
When i went to school in the suburbs the schools were pretty good.

Milwaukee was not as good but still not all that bad. Now its so bad I paid to send my kids to private schools. Then we got the voucher program which save a lot of money. The private schools only use a portion of the voucher as they can do a much better job for much less. Throwing money at a problem is not always a solution. In fact throwing money around can make things much worse.

Now if you want to continue this please contact me directly off group so we don't clog up the list with off topic discussions. I used to live in California, I miss it. Especially the weather. It was going bad years ago when I left and has gotten much worse since. I have a couple of brothers still living there. One will be retiring soon to another state. Sad to see the great state of California bled to death by clueless politicians. Things are not looking good for the country.

wrote:

Try Milwaukee Wisconsin. That's where they have double
pensions.
Her spend time at home sounds like she just likes to create
things. Certainly there is time in a day to do these things.
But
instead of staying at the school to do them I suspect she goes
home and does it there big Whoopie. A few nights she takes work
home. Teachers are not the only ones to do this. Welcome to the
working world.

Yeah I wish I lived in your neck of the woods. The public
schools
here in Wisconsin have a very lax grading system they use to
grade
themselves. Guess which school district failed that very lax
test?
... wait for it ... the Milwaukee public school system! All the
big cities are the same. Oh and the Milwaukee Public School
System
has just announced they will non longer use letter grades. Just
a
pass fail. Great way to hide their incompetence.

If you want the skinny on Wisconsin listen to the Mark Belling
talk show. You can listen online or download the podcast if
you're

not in his coverage area. I live in Milwaukee, grew up near
here.
When i went to school in the suburbs the schools were pretty
good.
Milwaukee was not as good but still not all that bad. Now its
so
bad I paid to send my kids to private schools. Then we got the
voucher program which save a lot of money. The private schools
only use a portion of the voucher as they can do a much better
job
for much less. Throwing money at a problem is not always a
solution. In fact throwing money around can make things much
worse.

Now if you want to continue this please contact me directly off
group so we don't clog up the list with off topic discussions.
I
used to live in California, I miss it. Especially the weather.
It
was going bad years ago when I left and has gotten much worse
since. I have a couple of brothers still living there. One will
be
retiring soon to another state. Sad to see the great state of
California bled to death by clueless politicians. Things are
not
looking good for the country.

When i went to school in the suburbs the schools were pretty
good.
Milwaukee was not as good but still not all that bad. Now its
so
bad I paid to send my kids to private schools. Then we got the
voucher program which save a lot of money. The private schools
only use a portion of the voucher as they can do a much better
job
for much less. Throwing money at a problem is not always a
solution. In fact throwing money around can make things much
worse.

Now if you want to continue this please contact me directly off
group so we don't clog up the list with off topic discussions.
I
used to live in California, I miss it. Especially the weather.
It
was going bad years ago when I left and has gotten much worse
since. I have a couple of brothers still living there. One will
be
retiring soon to another state. Sad to see the great state of
California bled to death by clueless politicians. Things are
not
looking good for the country.

So tell me than how does the "I Passed Extra Class Exam" thread with 80+ comments have anything more to do with the UV-5R than this thread? I don't see where you complained about that thread.

With both I just ignored them. Seems easier to do than adding to the threads with complaints.

Not sure I want to wade into this, but I have re-titled the
subject field so anyone can delete without reading. That said,
what is missing from the equation is PARENTS. I just do not see
how teachers alone can be held responsible for student
performance
without including PARENT performance and participance.

Don't leave your radio and/or spare batteries in your vehicle, or other cold places. I've never had a problem when the radio was on my belt as it's than usually under my jacket (I normally use a speaker mic).

I'm sure others have thoughts, comments.

There are no mobile/base rigs from China with the same value proposition
that the Baofeng HTs have. None of the ones I have seen are that much
cheaper than decent, high-quality mobile rigs from well-known brands. One
can get much better price/performance buying a used mobile radio than one
can get by buying a new Chinese mobile.

From: Xaun Loc
Topic: 34646 Message: 34681

Not to create a ruckus, but you do know that a 40KHz split CANNOT work in the real world.

I hope that you simply mistyped the frequencies (every time), because otherwise this looks like disinformation intended to deceive and confuse those who don't know better.

Even with a receiver that has decent selectivity (which the UV-5R does not) AND a really good multi-cavity duplexer or BpBr filtering the transmitter on 469.990 will always overwhelm the receiver on 460.950 unless the spacing is ridiculously far apart.

Also, I am very curious where you could be located that 469.990 MHz could even be a licensable frequency (it is certainly NOT a licensable frequency in the US)

-----Original Message-----
From: mikemccsolutions

I did multiple channels and alternates like talk around but here is my main setup:

Baofeng Receiver:

RX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)
TX: Same but doesn't matter

Motorola Transmitter:

TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

Handsets: Motorola HT1250's and HT750's

Channel 1 Main:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)

Channel 2 Talk Around:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

I Have a total of 6 Channels Programmed on the Handheld Radios, 16 Channels on the Motorola MaraTrac(TX), and currently I Haven't reprogrammed the Baofeng(RX) to show channels and names but I have manually put in the

settings. And Im using separate antennas so Im not using a Duplexer.

Attachments: 2 described; binary payloads are missing from this source WARC

Hi Lori,

More range (in transmit and receive) with the UV5R can be obtained in the UHF and VHF by upgrading the antenna. Please google “UV5R antenna” and see what you find. Eham is where I usually start my equipment searches. I want a better antenna too, and when I settle on one I’ll post what and why.

I understand from my light googling that the UV-B5 rubber duck antenna is much better than the UV5R stock duck antenna. You can see it on Amazon, here: http://www.amazon.com/Baofeng-Newest-Walkie-Talkie-5-watt/dp/B00BXVOKTW/ref=sr_1_1?ie=UTF8&qid=1380736222&sr=8-1&keywords=uvb5+radio

You should be able to buy that antenna separately if you search around.

If you decide to upgrade your antenna and are still dissatisfied with range, then consider purchasing a mobile or fixed 2m or dual band rig that has more than 4-5 watts of power.

I always like to optimize antenna and then upgrade if I’m not happy.

BTW, I borrowed CHIRP from a friend and got my 3 UV5Rs on the air…I still haven’t tried to update my CHIRP.cfg on my computer, but I will post results as soon as I do.

Regards and 73s,
WA2LXB

I would suggest not exposing it to too cold temperatures since it could affect the plastic case (could get more brittle) and battery performance might suffer. Also, as in all seasons, keep it dry. It's not waterproof. Other than that, I can't think of anything right now.

I don't think cold will hurt a battery until it gets below freezing. I'm not sure how low the temp can go without consequences but I never heard of a battery failing, just lowered capacity do to slow chemical reactions. Maybe someone here know about freezing lithium batteries?

In California where I used to live they had 1/2 watt repeaters high up on the mountains powered by a car battery and some solar cells. Those repeaters could easily reach several county's if not more. Antenna and antenna height are the main factors. Have you heard of QRP? If not Google "QRP wiki". Amazing low power stuff.

34689. Using the BaoFeng UV-5R as a repeater-Reply

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-02 19:21:50 UTC
From: <kk4khk@...>
Topic: 34689 Message: 34689

If you are in the United States I'm not sure this would be legal. Does the UV-5R comply with F.C.C. rules for use an approved radio for use as a repeater? It may be approved for use as a limited low power repeater by the F.C.C. But I would question that without any type of duplexer installed it would not meet specified requirements by a regional repeater coordinator. In an declared emergency it might be an acceptable emergency substitute. I think it would have to be researched to make any proper determination of legality. just curious, not complaining in any way

Thank you for your quick replies. I did order a better antenna instead of the rubber duck and plan to order a slim Jim. This is my first radio and it was so easy to program. I just read the posts, followed the chirp instructions and watched a few You Tube Videos. I was just curious since I had no problems getting this one going. I have been reading up on antennas and really want to build one but need to learn to solder first. (I did make a tiger tail with crimpers) I am already enjoying this hobby but know I have lots to learn. Guess I will keep reading the posts. Best 73's Lori

I hope that you simply mistyped the frequencies (every time), because
otherwise this looks like disinformation intended to deceive and confuse
those who don't know better.

Even with a receiver that has decent selectivity (which the UV-5R does not)
AND a really good multi-cavity duplexer or BpBr filtering the transmitter on
469.990 will always overwhelm the receiver on 460.950 unless the spacing is
ridiculously far apart.

Also, I am very curious where you could be located that 469.990 MHz could
even be a licensable frequency (it is certainly NOT a licensable frequency
in the US)

-----Original Message-----
From: mikemccsolutions

I did multiple channels and alternates like talk around but here is my main
setup:

Baofeng Receiver:

RX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)
TX: Same but doesn't matter

Motorola Transmitter:

TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

Handsets: Motorola HT1250's and HT750's

Channel 1 Main:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)

Channel 2 Talk Around:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

I Have a total of 6 Channels Programmed on the Handheld Radios, 16 Channels on the Motorola MaraTrac(TX), and currently I Haven't reprogrammed the Baofeng(RX) to show channels and names but I have manually put in the settings. And Im using separate antennas so Im not using a Duplexer.

Yes, the original dialog is from the older movie, but if you'd check you'd
fine that the wording used in the older movie was different.

> by the F.C.C.

Repeater equipment used in the Amateur Radio Service does not have to
approved by the FCC.

> But I would question that without any type of duplexer
> installed it would not meet specified requirements by a regional
> repeater coordinator.

Whether a repeater uses a duplexer is not something the frequency
coordinating body specifically cares about. If you can make your
repeater system work without one (such as by using separate receive and
transmit antennas with sufficient spacing between them), the freq
coordinator could care less about a duplexer.

> In an declared emergency it might be an acceptable
> emergency substitute. I think it would have to be researched to make any
> proper determination of legality.

Again, a lash up as what was described is perfectly legal if it were to
be used on ham radio frequencies. That person was using it on
non-amateur frequencies (469 MHz, I think he said) so the legality of it
in his case would be questionable.

just curious, not complaining in any way

I would suggest not exposing it to too cold temperatures since it could affect the plastic case (could get more brittle) and battery performance might suffer. Also, as in all seasons, keep it dry. It's not waterproof. Other than that, I can't think of anything right now.

Bob

As we all know, battery chemistry works better at warmer temperatures. The stock UV-5R battery that I have indicates pictorially "do not exceed 60C/140F" but has no lower operating temperature envelope.

You also make a good point with the brittleness of the plastic case on both the radio and the battery.

Not sure I want to wade into this, but I have re-titled the
subject field so anyone can delete without reading. That said,
what is missing from the equation is PARENTS. I just do not see
how teachers alone can be held responsible for student
performance
without including PARENT performance and participance.

wrote:

Try Milwaukee Wisconsin. That's where they have double
pensions.
Her spend time at home sounds like she just likes to create
things. Certainly there is time in a day to do these things.
But
instead of staying at the school to do them I suspect she goes
home and does it there big Whoopie. A few nights she takes work
home. Teachers are not the only ones to do this. Welcome to the
working world.

Yeah I wish I lived in your neck of the woods. The public
schools
here in Wisconsin have a very lax grading system they use to
grade
themselves. Guess which school district failed that very lax
test?
... wait for it ... the Milwaukee public school system! All the
big cities are the same. Oh and the Milwaukee Public School
System
has just announced they will non longer use letter grades. Just
a
pass fail. Great way to hide their incompetence.

If you want the skinny on Wisconsin listen to the Mark Belling
talk show. You can listen online or download the podcast if
you're
not in his coverage area. I live in Milwaukee, grew up near
here.
When i went to school in the suburbs the schools were pretty
good.
Milwaukee was not as good but still not all that bad. Now its
so
bad I paid to send my kids to private schools. Then we got the
voucher program which save a lot of money. The private schools
only use a portion of the voucher as they can do a much better
job
for much less. Throwing money at a problem is not always a
solution. In fact throwing money around can make things much
worse.

Now if you want to continue this please contact me directly off
group so we don't clog up the list with off topic discussions.
I
used to live in California, I miss it. Especially the weather.
It
was going bad years ago when I left and has gotten much worse
since. I have a couple of brothers still living there. One will
be
retiring soon to another state. Sad to see the great state of

California bled to death by clueless politicians. Things are
not
looking good for the country.

This is my first post to this list. Very interesting idea, to use the HT as part of a repeater.
Seems to me, that you could use two HTs as a repeater.
HTa is set to receive the receive frequency. HTb is set with VOX on. Connect the audio output from HTa to the microphone input on HTb,
Isn't it that simple? (separate the HTs by a number of wavelengths...)

Not to create a ruckus, but you do know that a 40KHz split CANNOT work in the real world.

I hope that you simply mistyped the frequencies (every time), because otherwise this looks like disinformation intended to deceive and confuse those who don't know better.

Even with a receiver that has decent selectivity (which the UV-5R does not) AND a really good multi-cavity duplexer or BpBr filtering the transmitter on 469.990 will always overwhelm the receiver on 460.950 unless the spacing is ridiculously far apart.

Also, I am very curious where you could be located that 469.990 MHz could even be a licensable frequency (it is certainly NOT a licensable frequency in the US)

-----Original Message-----
From: mikemccsolutions

I did multiple channels and alternates like talk around but here is my main setup:

Baofeng Receiver:

RX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)
TX: Same but doesn't matter

Motorola Transmitter:

TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

Handsets: Motorola HT1250's and HT750's

Channel 1 Main:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.950Mhz UHF TPL(CTCSS) 3Z(123.0Hz)

Channel 2 Talk Around:

RX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)
TX: 469.990Mhz UHF TPL(CTCSS) 1Z(100.0Hz)

I Have a total of 6 Channels Programmed on the Handheld Radios, 16 Channels on the Motorola MaraTrac(TX), and currently I Haven't reprogrammed the Baofeng(RX) to show channels and names but I have manually put in the settings. And Im using separate antennas so Im not using a Duplexer.

From: Alex De Carvalho
Topic: 34689 Message: 34708

Hi to everybody.

Technically you are not using it as a repeater but as a receiver. and there is nothing about it on part 97. the condition for a repeater is that identifies itself regularly and that the owner as some control over it. One classic example of this is the motorola gr500 that consist basically of 2 gm 300 radios with a rick interface and a duplexer. Another example is a repeater with a remote base you have a controller on the transmitter on one site and the receiver, normally a 2 radio setup (one receiver itself and a link radio to connect to the transmitter) on another site. so as far as you don't create harmful interference and comply with id's and control you are good to go. Another issue is the coordination of repeaters, a coordinated repeater per fcc part 97 have priority over uncoordinated ones as far as the coordinated one don't cause harmful interference or disruption with another ham or private repeater.

Subject: [baofeng_uv5r] Using the BaoFeng UV-5R as a repeater-Reply

If you are in the United States I'm not sure this would be legal. Does the UV-5R comply with F.C.C. rules for use an approved radio for use as a repeater? It may be approved for use as a limited low power repeater by the F.C.C. But I would question that without any type of duplexer installed it would not meet specified requirements by a regional repeater coordinator. In an declared emergency it might be an acceptable emergency substitute. I think it would have to be researched to make any proper determination of legality. just curious, not complaining in any way

Hi
this is my first new topic here on this group.
I am programming the radio thru the keyboard. But I am not sure if the CTCSS tones are being saved.
My impression is that I should set the tone and power levels etc first.
Then set the frequencies of receive and transmit.
The channel will have everything set now.
Is this the way it works?
thanks 73

Yes. Set all of the various settings first. Key in the RX frequency and store it into an empty channel. If it isn't a simplex channel, then key in the TX frequency and write it to the same channel. Once you have created a channel, the only parameters that you can update are the T-DCS code, T-CTCSs tone and TX frequency. Anything else requires the channel to be erased and programmed again.

I thought the indicator does change. Evenso, if the voice was not turned off, it should give you a warning when the battery gets low. Could be wrong. Never got mine that low.

I hound that the battery indicator only gives a single indication. When battery is dead it just dies with no warning or indication.

I was musing about the same thing. Since we had a bitty storm here last fall and the few times I listened, I heard no repeater activity, I was thinking of two Baofungs hooked up as a cross band repeater with separate antennas, a rechargable battery in an old ammo box. Maybe a solar panel or something else to recharge the batteries. Sprinkle a few of these mini-repeaters over a wide area so each in in the fringe of the next. Then you can have a large, powerful repeater with pl or a burst tone to communicate out of that area. This way you could have very local emergency communication (the minis would double or triple the HT range, small town sized) in several places and still get messages out on the big one if necessary. I thought it might be a better frequency usage since one repeater could get tied up with the traffic and AFAIK all the local repeater pairs are assigned. If the big one goes out, you would still have the minis for some communication. If one of those went out, the others might still work, maybe cover the hole. Iknow there are a lot of technical problems but I thought it might be an interesting application for these HTs and they are cheap enough to wipe a bunch a these little repeaters. Any thoughts?

This is my first post to this list. Very interesting idea, to use the HT as part of a repeater.

Seems to me, that you could use two HTs as a repeater.

HTa is set to receive the receive frequency. HTb is set with VOX on. Connect the audio output from HTa to the microphone input on HTb,

Isn't it that simple? (separate the HTs by a number of wavelengths...)

Is a possibility. but the main issue there will be that you have 2 or more minis receiving and transmitting the same frequency with the subsequent double feedback on them. Now one possible solution is one main transmitter on a high place done with one maxtrac or similar, with a 100w amp (output power on maxtrac will have to be program down to .250 watts, and use a ht has a receiver with another maxtrac as a link (the link radio can be a maxtrac, radius, sm 50 or similar radio from motorola or another brand) the different receivers can use pl or dpl to avoid activating more than one at the same time. I am sure there is another issues that our friends with more repeater experience than me (I'm the trustee for 443.550 in Miami, FL) can explain and propose solutions to.

I've got Kenwood commercial radios that do the same thing. That's why I carry spare batteries for a long event and always have more than one radio available, plus I charge often, especially when I'm sleeping as I've yet to find a need to use a radio while I'm sleeping.

Seriously, when the battery is discharged, slap a charged one on or change to a different radio with a fully charged battery. Depending on one radio and/or one battery is just stupid, in my opinion!

HI Bob:

A while back I got an interesting gadget at Radio Shack: it's a "simplex" repeater. Essentially an audio recording device that using VOX to start recording, and when the recording stops (or transmission exceeds 30 seconds), it plays back the audio at mic level via a cable which plugs in to most HT mic inputs and asserts the PTT line.

So, an incoming signal (up to 30 seconds) is recorded and "turned around" to be transmitted. Advantages are... simplicity and no need for any type of cavity or duplexer. Disadvantage: takes twice as long to send a transmission. But, it does work. Could be a good way to do a quick set up of an emergency repeater on a tall structure. The gadget makes no provision for ID, so someone would have to do that manually. And, there is no "control" available via RF.. it's manually turned on or off.

The annoying thing about a simplex repeater is they make a nice echo. Whatever you transmit is recorded and immediately replayed on the same freq. can drive you nuts, but it can come in handy. You can get a setup for around $90.00 that would come with your choice of cables to use with a variety of radios. If you are staying on ham freqs, use a mobile radio capable of crossbanding. Some older hts can crossband, also. If you set it up so everyone txs on uhf and rxs on vhf, it would only go one direction and act like an in band repeater.

Most simplex repeaters can be turned on or off with dtmf tones. As far as id'ing, regular ham radio ops will work, as there is only one freq involved. If nothing else, whoever owns the device can just say "this is WA7JRD on the WA7JRD simplex repeater.

I don't get the double feedback idea. All the minis would receive on the same frequency and transmit on the same frequency. It would be like the days before repeater coordination where two repeaters might be located close to each other with the same inputs and outputs, only a lot lower power and closer.

Mine gives two high-pitched beeps a short time before the radio powers down ... I've been exercising new 1800 and 3800 mAh batteries through three complete cycles each.

I'm familiar with those. Even have one around here somewhere. CW ID is not a problem if timed to go off at the right time. I think you can control it on the input if it is on 440 but not on 2 mtrs. But that would be very basic and only if you could get in. You'd loose it if some one else stronger was on which might be unacceptable. I was thinking cross band to avoid duplexes and such (the rigs are cheap enough). If a repeater club had a coordinated frequency, the minis could be on the same pair.
I know a higher power repeater is great but as I said, when Sandy hit, I did not hear any of the local machines (not that I was listening all of the time) and it doesn't matter how much power or antenna height If you ain't got the juice. :). BTW, the simplex repeater has one advantage...you can hear how you're getting in.

Topic: 34360 Message: 34731

A série B5/B6 (mesmo rádio, um com luz LED, com um botão de sintonia VFO) tem um receptor muito melhor do que a série UV-5R, mas o B5/B6 só tem 99 memórias enquanto o UV-5R tem 128 memórias. A série UV-5R tem mais opções de bateria
(AA pack, AAA pack, e 3800mAh bateria Li-Ion estendida), enquanto a série B5/B6 só tem a opção padrão de bateria Li-Ion (pelo menos por agora).

Simplex repeater - do a Google search on"Parrot repeater"
or check out http://radiopixie.blogspot.co.nz/2012/10/pmr446-parrot-repeater.htm

Ok lol got some good messages and some bad lol:

- I know its not a Linear Repeater, I was saying its "Like" a Linear Repeater mainly since it has almost no delay for transmit unlike common record then playback repeaters alot of people use.

- Im in Korea so I can use whatever frequency I want with no issues lol

- I did have Range Issues with the RX and TX overlapping but I have it that way because My MaraTrac was pre programmed and I don't have the cable to program it yet. But I was more concerned with it working period lol

- I did not post this to confuse any one, I just want to help people who cannot afford the better setups. Like Duplexers, etc......

- Not interested in simplex repeaters at all since im looking to extend range in a shared area, not two isolation with a relay.

- For the guy talking about VOX Setup, I have done that successfully with two Baofeng 888S and it worked great, but not what I want since I wanted that 100watt coverage from my MaraTrac and the MaraTrac does not have a VOX Feature.....

Don't forget to change the antenna. You want at least an all-season antenna, but at higher latitudes you might need a good winter antenna. Using the radio with the summer antenna during the cold winter nights can be dangerous. It could slide off frequency before you have a chance to react.

From: <toshutrinity@...>
Topic: 34735 Message: 34735

Where I live, there is relatively light traffic on 2 m and 70 cm, but I just found out that there is an Echolink repeater by me, and that by going thru it I can access other Echolink nodes on the planet.The Echolink code by me is 54045. It is also an IRLP node of 4291.

My question is, can I access these new wonders directly from the Baofeng and if so, exactly how???

I may be asking this incorrectly but bear with me. I just got my radio and Tech license 6 weeks ago.

If you use an outside antenna during the cold months, don't forget to spray the inside of the coax with WD-40. This helps the signal squirt out faster....

HI Jim:

Sadly, I think the item is no longer available, but it's called a "Simplex Repeater Controller" #19-345. Supposedly compatible with Radio Shack amateur and business band hand-held HTs (like the HTX-2902) and Alinco, Standard, Icom, Yaesu and others. The unit is a low-current item and according to the package blurb, batteries typically last for 2 months. It's powered by 4 AAA cells. And there is a jack for external power. (12V @ 100 mA., center positive). There's no controls on the gadget... not even a power switch. It does come with a "Y" cable to connect to the repeater via one 3-circuit 2.5mm plug and two plugs at the other end (2.5mm 2-circuit and a 3.5mm 2-circuit). There is a green LED on the front which lights when it's repeating.

IIRC, MFJ has a very similar item and likely operates the same way.

34738. Scanning speed question - kind of trivia

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-03 14:37:55 UTC
From: Loureiro, Antonio
Topic: 34738 Message: 34738

Hi all.

This is 'kind of trivia' because I know the Bao scans 3 freqs/channels per second and it's listed in the doc. But I can't find any info comparing it to other pro or recreational radios capabilities.
So, if anyone knows....
1]does the bao scan 3 channels AND ALL its squelch codes/sub tones within 3 seconds?
2] how does it compare to police scanner, portable ones AND our dear TalkAbout@ (they seem fast to me! Is bao even slower) ?

Thanks guys

Antonio E Loureiro

Using polyurethane foam to insulate, or even cardboard with duct tape to seal any openings that allow drafts in, then cover everything including the unit with a cover (homemade or store bought). It doesn't look great, but it helps to reduces the amount of energy used to keep your unit warm and comfortable.

Ebay shows lots of simplex repeaters with your choice of cables. Also, a Google search should bring up several.

Actually, my 5R does give a graduated battery display. However that curve’s drop-off is pretty rapid.

So, if you loose one bar, get out your spare... you’ll need it soon, very soon!

Subject: RE: [baofeng_uv5r] UV-5R Doesn't give proper battery level

I thought the indicator does change. Evenso, if the voice was not turned off, it should give you a warning when the battery gets low. Could be wrong. Never got mine that low.

Subject [baofeng_uv5r] UV-5R Doesn't give proper battery level

I hound that the battery indicator only gives a single indication. When battery is dead it just dies with no warning or indication.

YES! And I have done this myself. You are partway there. You are aware of the node numbers.

UV-5R Set Menu 16 to "DT-ST" to enable transmitting DTMF tones.

To produce the DTMF tones you simply press the numbers on the keypad while pressing the PTT button.

Here are links about using IRLP.

http://www.irlp.net/guidelines.html

http://status.irlp.net/ These are IRLP Nodes

Echolink:

To establish a Echolink connection, perform the following steps:

It is recommended that you first identify your station on the repeater and that you are attempting Echolink operation.

Optionally, you can determine if the Echolink gateway is operational by keying a "*" DTMF tone. The gateway node will respond with status information.

Key the four or five digit station code for the station or repeater that you wish to link to.

After a few seconds delay, the Echolink node will respond with a "Connected" message if the link was successful. If the link was not successful, key a "#" to disconnect the gateway node.

Following a successful connection, announce your presence on the linked repeater by calling CQ, etc.

During a QSO using linked repeaters, let the repeater tail completely drop before transmitting to avoid any timeout problems.

At the end of the QSO, disconnect the link by keying a "#" DTMF tone. The Echolink gateway will respond with confirmation that the link has been disconnected.

If you are accessing an EchoLink controlled Internet Link from RF, you will require to transmit DTMF tones to control your QSO with other stations. This can be done with a handheld transceiver's keypad, a DTMF microphone or a small handheld dialler. You will notice that Internet Links (-L) and Repeaters (-R) have a numerical Node ID as do Amateur Stations that are connected to the Internet.

Command Function DTMF Key

Info Request By pressing "*" will ask the Node to play an ID message. *

Connect Enter the Node ID number of the station you want to connect to. NNNNN

Random Node By pressing "00" the system will connect you to any available Node. 00

Random Link By pressing "01" the system will connect you to any available Link or Repeater. 01

Random Conf Selects a conference server at random and tried to connect to it.. 02

Random User Selects an available single-user station at random and tries to connect to it. . 03

To check if target node is online 06 Node Number

Status Announces the callsign of each station currently connected. 08

Reconnect Reconnects to the station that was most recently disconnected. 09
If more than one station is connected, disconnects only the
most-recently-connected station.

Disconnect Press "#" to disconnect. #

A receiver is a receiver and a transmitter is a transmitter -- a repeater is just a receiver and a transmitter connected by some sort of controller.

> Seems to me, that you could use two HTs as a repeater.

Done regularly by lots of people.

> HTa is set to receive the receive frequency.
> HTb is set with VOX on. Connect the audio
> output from HTa to the microphone input on HTb,

More or less...

> Isn't it that simple? (separate the HTs by a number of wavelengths...)

As your callsign shows you certainly already know, it isn't quite that simple. The audio input impedance and level requirements generally need some additional circuitry for decent operation.

And, of course, THIS group is about discussing the BaoFeng UV-5R which is notorious for problems with front end overload and poor selectivity. The UV-5R is terribly unsuitable for use as the receiver for a repeater unless you can achieve a much greater degree of isolation than the notion of connecting two radios together would generally make possible.

All HTs have duty-cycle limitations that make them poor candidates for repeater transmitters. The UV-5R is well known for having more such problems than most brand name HTs of similar size. The UV-5Rs are also known for considerable variation from one identical radio to the next. Some UV-5Rs are capable for transmitting for as long as 2-3 minutes, but far more of them show various signs of overheating after one minute (or even less) of continuous transmitting. The complete lack of heat sinking on these radios limits the best performance that could be expected, then the variations in component quality and construction quality from one radio to another only make those problems worse.

So, yes, it is absolutely possible to build a repeater using an HT as a component -- or even two HTs as the transmitter and receiver -- but the UV-5R would be about the LAST choice for use as either the receiver or transmitter component for a real world repeater.

Of course not. Each channel can be programmed with 1 R-CTCSS tone or 1
R-DCS code or both can be set to OFF. When the radio is scanning, it is
only concerned with tone/code that has been programmed into a channel and
ignores all other tones/codes.

2] how does it compare to police scanner, portable ones AND our dear
> TalkAbout@ (they seem fast to me! Is bao even slower) ?
>

There is no comparison. The UV-5R is a two-way radio that happens to scan
like a scanner, not a scanner that happens to transmit like a two-way
radio. The only purpose for the 'police scanner' is scanning. It better be
good at it.

>
>

One point of clarification. Menu 16 (DTMFST) does not enable/disable over-the-air transmission of DTMF tones. When any one of the 16 keypad keys is pressed while the UV-5R is transmitting, the corresponding DTMF tone is always transmitted over-the-air. What DTMFST (aka DTMF Side Tone) does is establishes when and if the tones will also be heard in the speaker or not.

I prefer to hear when my HT is transmitting DTMF tones so I have menu 16 set to DT+ANI. But if you had a need to transmit DTMF tones without others near you hearing them, you can do it with menu 16 set to OFF. The choice is yours.

If you can find some at your local CB shop, get some velocity factor grease and liberally coat the coax and any portion of the exposed antenna, it really helps to keep those electrons firing at top speed. Be careful to get the VHF/UHF version, you don't want to screw up any pile-ups on 20m!

I tape a few packets of salt and pepper to the battery case, just in case. The salt will melt the antenna reception icing and the pepper provides additional transmitter traction during periods of low auroral activity.

If you have a memory channel set that you want to scan, it will just use whatever tone you have set on that channel. If you know a frequency for a repeater but don't know the tone, monitor the input freq of the repeater and scan for the tone. Two totally different ops.

With some minor, and recently relaxed, restriction on linears below 50 Mhz,
the FCC does not have any requirements, other than complying with good
engineering standards and practices, on what Hams can use in their bands.
We can, and our encouraged, to home brew and experiment.

We can convert something certified for other services, such as CB, GMRS,
MURS, FRS or Public Land Mobile, and use in it Ham. But one cant convert
a Ham rig to use it in any other service.

> Hmm ok, that makes sense. Although annoying.
>We must previously set/tell Bao which channels & tones to scan.

Yes, which, by the way, is true of every radio made anywhere in the world.

The UV-5R (like nearly all scanning capable radios) will scan EITHER the specific frequencies you program into memory OR it can scan a range of frequencies.

The notion of wanting the radio to scan through all the possible tones and DCS codes would appear to indicate that you don't really understand what those tones and codes are used for.
The only purpose of setting a tone or DCS code on the receiver is to PREVENT it from hearing unwanted signals. If you want it to receive all signals on a particular frequency, you would not program any tone or code at all.
There is very rarely any reason to ever program a Receive tone or code. New users are strongly discouraged from programming receive tones or codes, because they rarely accomplish what they think they were trying to do.

No CTCSS Tone or DCS code is ever needed to receive a signal!

As others have told you, the UV-5R is quite possibly the worldÂ’s poorest excuse for a scanner. If what you want is a scanner Â– buy a scanner Â– do not buy a UV-5R which will start out by making you unhappy, followed quickly by you making all of us unhappy when you start posting about it not doing things it was never meant to do.

For example, you mention that the scan rate on the UV-5R is nominally 3 channels per second. I have never had the patience to bother clocking its glacial scan rate. I think the actual rate is slower, but letÂ’s assume that 3/sec is correct. In memory channel mode, it would then take the radio about 43 seconds to scan through the 128 memory channels (assuming it didnÂ’t stop on random static Â– as it certainly will) Checking each channel at best once every 43 seconds means it will miss many transmissions entirely Â– and will stop on a channel in the midst of a transmission most of the time rather than having much chance of being near the start of the transmission.

In frequency mode, the radio would scan each step. With the step size set to 2.5 KHz (as it would need to be for commercial or public service channels) the radio would take nearly 2 seconds to move from one actual frequency to the next possible frequency.

The typical scan rate of a real scanner today is 100 channels per second Â– with good scanners the rate can be faster.

34774. UV-5R Arrived

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Timothy-Allen Albertson
Topic: 34774 Message: 34774

After a longer wait than expected, my UV-5R, together with some accessories including a CAT cable, arrived. Now I will get the thing working to see if it as good as folks around here say.

And thanks for all of the good advice and info I have already received from this group.

Barry;

Your 100% correct. The problem here in the USA is that they are not legal to use since they are not certified for said services .

Yes... that's the point. Even though a particular piece of ham gear -
could- be programed, modified or tuned to be used for other
frequencies as used by other services, it's not legal to use that gear
unless it has been approved for the service in question. Commercial
gear generally costs more than ham gear, in part, presumably because
of the certification requirements.

Subject: [baofeng_uv5r] RE: 5R and accessing Echolink

YES! And I have done this myself. You are partway there. You are aware of the node numbers.

UV-5R Set Menu 16 to "DT-ST" to enable transmitting DTMF tones.

To produce the DTMF tones you simply press the numbers on the keypad while pressing the PTT button.

Here are links about using IRLP.

http://www.irlp.net/

http://www.irlp.net/guidelines.html

http://status.irlp.net/   These are IRLP Nodes

Echolink:

To establish a Echolink connection, perform the following steps:

It is recommended that you first identify your station on the repeater and that you are attempting Echolink operation.

Optionally, you can determine if the Echolink gateway is operational by keying a "*" DTMF tone. The gateway node will respond with status information.

Key the four or five digit station code for the station or repeater that you wish to link to.

After a few seconds delay, the Echolink node will respond with a "Connected" message if the link was successful. If the link was not successful, key a "#" to disconnect the gateway node.

Following a successful connection, announce your presence on the linked repeater by calling CQ, etc.

During a QSO using linked repeaters, let the repeater tail completely drop before transmitting to avoid any timeout problems.

At the end of the QSO, disconnect the link by keying a "#" DTMF tone. The Echolink gateway will respond with confirmation that the link has been disconnected.

If you are accessing an EchoLink controlled Internet Link from RF, you will require to transmit DTMF tones to control your QSO with other stations. This can be done with a handheld transceiver's keypad, a DTMF microphone or a small handheld dialler. You will notice that Internet Links (-L) and Repeaters (-R) have a numerical Node ID as do Amateur Stations that are connected to the Internet.

Command Function DTMF Key

Info Request By pressing "*" will ask the Node to play an ID message. *

Connect Enter the Node ID number of the station you want to connect to.
NNNNN

Random Node By pressing "00" the system will connect you to any available Node.
00

Random Link By pressing "01" the system will connect you to any available Link or
Repeater. 01

Random Conf Selects a conference server at random and tried to connect to it..
02

Random User Selects an available single-user station at random and tries to connect to
it. . 03

To check if target node is online 06 Node Number

Status Announces the callsign of each station currently connected. 08

Reconnect Reconnects to the station that was most recently disconnected. 09
If more than one station is connected, disconnects only the
most-recently-connected station.

Disconnect Press "#" to disconnect. #

The short answer is NO. The keypad lock just locks the keypad buttons on the front of the radio. All three buttons on the side are not affected by the keypad lock function.

The FM function can be disabled using software. And as already mentioned, menu 32 (AL-MOD) can be set to SITE so at least accidental activations of the alarm won't be transmitted over-the-air.

I got these instructions from Bob (bgiff158, the developer of the CHIRP LiveCD).

http://sourceforge.net/projects/chirplivecd/

Plug in your cable and issue the following in terminal:

dmesg | grep tty

Look for /dev/TTYUSB0 (or something similar) along with your chip name CP210x, that will be the port your cable is plugged into

In order to run Chirp as a normal user, execute the following from terminal: (if upgrading your install, you won't have to do this since you did it when you installed the first time)
sudo usermod -a -G dialout <your user name>

It may be under /dev/ttyACM0. (The formal name for the serial port driver is a “CDC ACM – Communications Device Class, Asynchronous Control Model".)

I should have made it more clear. The formal name for a USB-to-serial driver is “USB CDC ACM – Communications Device Class, Asynchronous Control Model". That’s where /dev/ttyACM0 comes from.

I got these instructions from Bob (bgiff158, the developer of the CHIRP LiveCD).

http://sourceforge.net/projects/chirplivecd/

Plug in your cable and issue the following in terminal:

dmesg | grep tty

Look for /dev/TTYUSB0 (or something similar) along with your chip name CP210x, that will be the port your cable is plugged into

In order to run Chirp as a normal user, execute the following from terminal: (if upgrading your install, you won't have to do this since you did it when you installed the first time)
sudo usermod -a -G dialout <your user name>

I want to put this out there while I finish writing this up and do the UHF testing.

W9MDB VHF test conducted 10/5/2013 1030-1200 in Quincy IL. Weather was sunny

Receiver was IC-706MKIIG calibrated at 146MHz with Elecraft XG3 and MFJ-762 attenuator at S9=0dB

S Meter Lite version 2.23 displayed calibrated dB units

Webcam watched home computer screen while transmitting from remote location and watching webcam for dB results

Distance 2.05 miles

UV-5R used while sitting in chair, held approx 2 inches from face

Note: Obtained 15dB gain with A-V85 by moving antenna 12" from face and using external mic

Black text is regular antennas, Red is extendables, Cyan is mobiles.

Very interesting, could you better define your methodology as to what you are measuring, normally an S meter
displays a voltage reading with a 6 dB change equals one S unit.

34804. RE: [baofeng_uv5r] Antenna Testing

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-06 12:39:44 UTC
From: Michael Black
Topic: 34802 Message: 34804

And here☐s a graph of the results that lends a fair bit of credence to ☐longer is better☐.

You can see the 2☐ SRH805s is horrible, the ~8☐ have about a 10dB span, the ~15☐ have about a 10dB span, and the ~40☐ have about a 10dB span.

Mag mount doesn☐t buy you more power but, of course, would work better from inside a car than any other antenna.

14.8dB -- The ½ wave extendable winner is the Harvest RH-660S but at 43☐ that☐s quite a length. All 3 ~43☐ antennas are pretty heavy and not real suitable for portable use and could put a strain on the connector. But if your careful they are the way to go.

2.9dB -- The ~15☐ winner is the Diamond RH771 with the Powerwerx WXGAT-ST only 0.8dB behind the RH771

0.4dB ☐ The 21☐ extendable Smiley 270A gets you only 0.4dB more than the NA-773 for 4☐ more length.

0.0dB -- The shorter extendable ~15☐ winner is the Nagoya NA-773

-0.8dB -- The ~8☐ winner is the Baofeng A-V85 (surprise!). Too bad you can☐t just buy one of these (that I know of).

-9.8dB -- the A-5R ☐stock☐ Baofeng antenna sits at the bottom of the list as one of the only 5☐ antennas but still beats a couple of Nagoyas

So if you can stand a 15☐ antenna the Diamond RH771 is the way to to.

I kept retesting that antenna between the other and it consistently outperformed everybody and served as my benchmark that these number are relevant to each other.

I would says these measurements are +/- 2dB for the most part. I made a strong attempt to hold the radio in the exact same position every time.

But the closer you put the antenna to your face the more power you lose so my ability to absolutely duplicate the exact conditions is limited just a bit.

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of Michael Black

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Antenna Testing

I want to put this out there while I finish writing this up and do the UHF testing.

W9MDB VHF test conducted 10/5/2013 1030-1200 in Quincy IL. Weather was sunny

Receiver was IC-706MKIIG calibrated at 146MHz with Elecraft XG3 and MFJ-762 attenuator at S9=0dB

S Meter Lite version 2.23 displayed calibrated dB units

Webcam watched home computer screen while transmitting from remote location and watching webcam for dB results

Distance 2.05 miles

UV-5R used while sitting in chair, held approx 2 inches from face

Note: Obtained 15dB gain with A-V85 by moving antenna 12" from face and using external mic

Black text is regular antennas, Red is extendables, Cyan is mobiles.

34805. RE: [baofeng_uv5r] Antenna Testing

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-06 12:48:41 UTC
From: Michael Black
Topic: 34802 Message: 34805

I didn’t use the S meter per se.

I used S Meter Lite which does direct raw readings from the radio.

I calibrated S Meter Lite’s dB scale using the XG3 and MFJ-862 explicitly at 146MHz (this calibration is a function of S Meter Lite and not the radio).

I also calibrated S Meter Lite’s S meter values but I didn’t bother recording them since I prefer the dB scale.

That’s why I said I watched the webcam for the dB results and not S meter results.

So these relative dB scales are pretty accurate.

Very interesting, could you better define your methodology as to what you are measuring, normally an S meter

displays a voltage reading with a 6 dB change equals one S unit.

Mike, very interesting stuff.

Related to the comment below, couldnt a remote mike help in the situation, where you hold the HT with one hand and talk into the remote mike in the other??

BTW, these DB ratings are "relatve" and not actual correct??

Tony

But…the closer you put the antenna to your face the more power you lose so my ability to absolutely duplicate the exact conditions is limited just a bit.

From: Michael Black
Topic: 34802 Message: 34807

I noted the 15dB gain when holding the radio away from you.

So yes….that does help immensely…and it’s free!

And yes the measurements are relative to S9=0dB rather than dBm.

But just subtract 73 dB if you want dBm measurements (i.e. S9=-73dB instead of S9=0dB)

Mike W9MDB

I buyed this http://www.ebay.com/itm/NAGOYA-NA-771-SF-SMA-antenna-Wouxun-TK-2107-KGUVD1P-PX-888K-Baofeng-UV-5R-S9-/390637167048?pt=UK_Mobile_Phones_Communication_Radio_Antennas&hash=item5af3ca21c8

Very good and inexpensive (US$ 4,63)

Well, if you’re going to do something like that, now would be the time,
while the government is SHUT DOWN and the FCC is doing idiot things like turning
off their websites to play the Democrat games.

Note: I do NOT recommend this!

That's not true. Many people have.

That doesn't make it legal.
Just because people
do things doesn't make it right, they just didn't get caught.

Both sides are to blame in this case, since it's clear that neither side wants to give an inch on the Affordable Care Act (which is turning out to be even less affordable than originally suspected).

Now, can we get back to the UV-5R and related radios and communication related topics please?

I don't have this model, but isn't that a 2m/220 version? Read the specs listed in the owner's manual.

Unless your radio was specifically designed to work on 220, all you have
done is trick the radio into allowing the entry of the 220 MHz frequencies,
not to allow the radio to actually transmit there.

Date: 2013-10-07 04:44:38 UTC
From: Paul Nourse
Topic: 34689 Message: 34815

The Republicans did pass a bill and the Democrats do jot want to compromise. The president refuses to even talk to the Republicans, but yeah somehow it must be all the republicans fault because that's all we hear from the media carrying Berry's water.

The Dems keep saying elections matter and expect then other side to lay down and die for them. We do not elect a king who can do great harm with his corruption. We elect many people to three branches of govt so many corrupt people have a very hard time doing harm to the people.

The house of representatives were duly elected and their phones are being rung off the wall because the majority of people do jot want the unaffordable ACA (Affordable Healthcare Act) that was shoved down our throats by the Democrat party without one single Republican vote. A bill so bad they had to bride and coerce their own party members. A bill no one read before passing it! Based on lies like "you can keep your doctor", "it will reduce your premiums" and "it will insure millions who do not have insurance". The last one is sort of true. Millions of young people who are otherwise healthy will be forced to buy expensive insurance to pay for old peoples healthcare. Of the millions who really need healthcare will still have no insurance. But the fine they will have pay now should really improve things.

So how come the Republicans don't lay down and surrender like the democrats did when they lost a Presidential election??? Oh wait... that's right the the Democrats never laid down and surrendered.

If standards are good then double standards must be twice as good!

Just wake up and open your eyes and see how we are being screwed. Its not one party doing the screwing. And when the politicians occasionally do what the people they represent want its usually because the politicians fear for their own jobs.

Ask yourself if the ACA was such a good thing then why did the congress exempt themselves from it?

Why did our politicians exempt parts of govt? Why are unions fighting tooth and nail for exemptions?

If the ACA is law and somehow it can not be changed or repealed by the Law Makers then how is it they let Barry aka Obama can change it to exempt congress? We do not elect a king. It was unconstitutional for the President to, all on his own, change the law.

Yet Obama gave waviers to his big baseness friends and to congress. He merely used raw power to do it knowing no one in govt, especially his own party, would stop him.

I don't know about you but I'm concerned about an all powerful govt that puts the IRS in charge of our healthcare. The same IRS that was, and is, still targeting enemies of the administration.

I mean we all love the IRS. No one really fears the IRS... right? It will be so much better when we replace insurance companies who we can sue with govt bureaucracies we can not sue. Bureaucracies that have no skin in the game regarding your healthcare. I'm sure that faceless bureaucrat will really care if you live or die and fight tooth and nail on your behalf just like the IRS does now on behalf of your taxes. The IRS does root for you when it comes to taxes doesn't it? Oh maybe not so much. :-(

So I can't get a vanity call sign because the administration is trying to make us feel the pain. Big deal, better a little pain now...

radio or a VHF/220 radio. CHIRP does not manipulate this byte itself, so
this byte got changed some other way.

The only way that I can think of for changing this byte would be by
messing around with the options in the Other menu of the VIP software.
Another would be by loading in an image file that was originally from a
VHF/220 radio. If there is another way, I would be interested in knowing
what it was.

This can easily be fixed. I was waiting on you to provide you firmware
version so I could provide more specific instructions.

Another alternative would be for you to email me your CHIRP image and I
will email it back with the necessary changes. uv5r [at] kc9hi [dot] net

I was kinda' hoping that the soapbox would be getting slippery
with all that spit flying around.

Because its a repeat of the last off topic thread. :-(
Sorry I couldn't help myself. :-(

Stepping away from keyboard now...

>
>
>The Dems keep saying elections matter and expect then other side to lay down and die for them. We do not elect a king who can do great harm with his corruption. We elect many people to three branches of govt so many corrupt people have a very hard time doing harm to the people.
>
>
>The house of representatives were duly elected and their phones are being rung off the wall because the majority of people do jot want the unaffordable ACA (Affordable Healthcare Act) that was shoved down our throats by the Democrat party without one single Republican vote. A bill so bad they had to bride and coerce their own party members. A bill no one read before passing it! Based on lies like "you can keep your doctor", "it will reduce your premiums" and "it will insure millions who do not have insurance". The last one is sort of true. Millions of young people who are otherwise healthy will be forced to buy expensive insurance to pay for old peoples healthcare. Of the millions who really need healthcare will still have no insurance. But the fine they will have pay now should really improve things.

34820. Re: [baofeng_uv5r] Band changed to 220

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-07 05:06:13 UTC
From: Paul Nourse
Topic: 34811 Message: 34820

If it is just one bit (isn't that one byte) could it be corruption from things like background radiation. In home computers ram gets corrupted all the time from gamma rays occasionally interacting with a single bit causing it to flip. Not sure if that is likely in non-volatile memory. Anyway its why servers use memory with a parody bit to help catch single bit errors.

34821. new to ham radio/baofeng

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-07 05:18:26 UTC
From: Richard Sparks
Topic: 34821 Message: 34821

I am new to ham radio and I have just purchased a baofeng uv5r plus

I have yet to receive any transmissions on my unit and I will be loading in frequencies once I get my programming usb cable. I was hoping someone could point me in the right direction on how to set up my unit - there are a lot of settings I know nothing about. There are many posts on updating my firmware (BFB297) is this necessary for me to be able to use the unit properly? my main objective is to be able to listen in on frequencies (police, fire, taxi, etc) but I have no idea on how to achieve this. Im sure there must be posts for people like me who know very little about all this.

Thanks

Welcome to the group. :-)

USER GUIDE: www.miklor.com/uv5r/UserGuide
.
UV-5R FAQ: www.miklor.com/uv5r/FAQ

You will find these links at the bottom of every post to this group. But who looks at the junk on the bottom of emails. I know I don't. :-)

Do you have your Amateur radio license, if so which one?

If you need further assistance just ask and some of the more knowledgeable here will help. Its a fun group. :-)

Sincerely
Paul AC9GL

Im also concerned about having to update my firmware using chirp - are any or all of these things necessary in order to listen to frequencies? what im planning on doing is once i get my usb lead is to upload the uhb cb channels (which i found on this site) and then scan and hope for the best. Ive also bought some new ariels as ive been led to believe that the one that came with the unit isnt very good.

Its a radio that can scan, poorly. You really want a scanner although the UV5R is a very inexpensive. Did you say CB? CB is AM and the UV5R only receives FM.

Why would one discard 136-144 MHz and 400-430 of the radio's capability with such a choice?

Highly unlikely. More chance on a firmware bug than radiation. Unless you
are operating your transceiver in a close proximity with a cyclotron there
is no chance that you will ever get a bit flip in flash memory.
As for computer RAMs, it doesn't get corrupted all the time by radiation.
It's totally exaggerated. It can happen but that's not the main part of the
software crashes.

For the transceiver, have you done a factory reset ?

--

Sorry, given the vendor's statement of "Frequency: 144/430MHz", that should have been:

Why would one discard 136-144 MHz and 430-480 MHz of the radio's capability with such a choice?

There are no posts on updating the firmware. It can't be done. The chip with the firmware is a One Time Programmable chip and the one time was done in the factory. There has not been enough difference between firmware versions to concern yourself with which one you get. You can be fairly certain that if the [3] + Power-on firmware message is BFB-297, you do not have BFB297. All firmware versions newer then BFB297 all masquerade as BFB297. You have to use CHIRP to find out what the 'real' firmware version is. Once again, there is no need to be concerned about the firmware version because the differences between them have been mostly transparent to the radio user.

Yeah that's what I figured. Actually with gigs of ram and the numbers of computers in the world its not that rare of an occurrence. Most times the corruption is insignificant and doesn't effect operations.

Studies by IBM in the 1990's suggests computers typically experience about one cosmic ray inducted error per 256 meg of RAM per month.

>If it is just one bit (isn't that one byte) could it be corruption from things like background radiation. In home computers ram gets corrupted all the time from gamma rays occasionally interacting with a single bit causing it to flip. Not sure if that is likely in non-volatile memory. Anyway its why servers use memory with a parody bit to help catch single bit errors.

The default settings should be fine, as for uhf cb channels its 100% possible, just look for a conversion table (here: http://www.radioaficion.com/HamNews/archivo/vagabundos-del-dial/10094-uhf-cb-channel-guidelines.html) , ch1- "476.425" to ch40- "477.400". If there is any chance your in Australia than just check the acma database (http://web.acma.gov.au/pls/radcom/register_search.main_page) of sites in your postcode. Click on the license numbers and look for qps/qas/taxis ect www.aussiescanners.com is also helpful. It takes a bit of searching but you'll figure it out. I'm not sure if there is systems like that in other country's but a simple google search should turn up what your looking for, then just enter the frequency into the device. Ive had alot of luck with just using the search function after a bit of patience aswell. I only got my uv-5r not long ago and its confusing at the start but you'll get the hang of it :)

Hi Richard,

On Mon, Oct 7, 2013 at 1:18 AM, Richard Sparks <yobydnub@...> wrote:

I am new to ham radio and I have just purchased a baofeng uv5r plus

I have yet to receive any transmissions on my unit and I will be loading in frequencies once I get my programming usb cable.

The factory supplied channels are for factory testing only. I wouldn't expect to hear anything on any of them. You need to find frequencies in your area and program them in. I would start off by keying in the weather radio frequency for your area into one of the VFOs. It broadcasts 24/7 so you should receive it any time night or day.

I was hoping someone could point me in the right direction on how to set up my unit - there are a lot of settings I know nothing about.

Visit the Miklor.com website. On the UV-5R home page look for Menu Detailed Reference. It will have links to the Reference for UV-5R Menus. This guide tries to explain all if the menu and suggest settings for some of the more obscure ones.

There are many posts on updating my firmware (BFB297) is this necessary for me to be able to use the unit properly?

There are no posts on updating the firmware. It can't be done. The chip with the firmware is a One Time Programmable chip and the one time was done in the factory. There has not been enough difference between firmware versions to concern yourself with which one you get. You can be fairly certain that if the [3] + Power-on firmware message is BFB-297, you do not have BFB297. All firmware versions newer then BFB297 all masquerade as BFB297. You have to use CHIRP to find out what the 'real' firmware version is. Once again, there is no need to be concerned about the firmware version because the differences between them have been mostly transparent to the radio user.

my main objective is to be able to listen in on frequencies (police, fire, taxi, etc) but I have no idea on how to achieve this.

Then you need to get a programming cable so that every channel that you program has TX inhibited.

Im sure there must be posts for people like me who know very little about all this.

Cb is AM. Some models give you the choice of USB or LSB. If it wasn't AM, why would there be 3choices on the fancier models?

Thank you for all your help so far.

I have been trying to find the radio frequency for brisbane but ive had no luck - are you aware of any websites to help me find this.
One more question - what is a VFO?

I know i probably sound stupid but I am really new to all this. I have tried keying in frequencies that I have found online but I get no transmissions - I think maybe I am doing something wrong...

Oh I have one more question.

I read that when you need to key in the 7th digit, you set your step to 2.5, and if the 7th digit is a 5 you hit the up arrow key. If the 7th digit is a 0, I presume you hit the down arrow key.. is that correct?

34845. Re: [baofeng_uv5r] RE: Nagoya Dual Band SMA UV Antenna

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-07 11:23:03 UTC
From: Colorado Rob
Topic: 34431 Message: 34845

Because they have no need for it? Every antenna is a compromise. An antenna that is tuned to a narrower range of frequencies will perform better on those frequencies than one that is "wide band", especially on TX. Radio amateurs have little need for frequencies outside the 2m and 70cm ham bands with these radios.

Yes I am in australia - Im in Brisbane. I have had little luck getting anything except the FM to work. Ive been told I should be able to get the weather (at least to try and test it out) but any freq. that I find and key in just do not do anything. I have had some transmissions (the unit changes colour on the display) but still no sound. I have bought a better areiel but am waiting for that in the post. Im beginning to think that I have bought and expensive FM radio.. but im hanging in there...

If you're expecting constant chatter you will be disappointed. About the only place that happens here is on a NOAA channel which talks constantly.

You may have to park on a frequency for hours before you hear anybody.and apparently Brisbane metro is digital and encrypted which means you won't hear them at all.

http://coolisit.tripod.com/id1.html

For entering 2.5kHz freqs you can either enter the frequency just below it or just above it and use up/down respectively and you'll see the 2.5khz result on the screen.

That is not true in every jurisdiction. We have people from all over the world on this forum. Just because many people here fall under the jurisdiction of the FCC does not make their rules a universal truth.

I would suggest you try contacting your local radio club..assuming they are a helpful bunch they can point you in the right direction.

http://www.wia.org.au/clubs/vk4/BrisbaneAmateurRadioClub/

I notice they meet twice a month which sounds like a pretty busy/social group.

Show up at a meeting and you can likely get some help.

Topic: 34738 Message: 34851

Thanks Xaun, that was really helpful.

My first intended use for my radio is actually communication during search/rescue and emmergency (mountain) scenarios
The info you gave me actually helped - by simple math/time - how I'd rather set my scanning option [freq range] over the freqs each area uses for emmergency services, NO TONE, and I now what to expect when it comes to freq search cycle.

Subject: Re: [baofeng_uv5r] Scanning speed question - kind of trivia

From: Loureiro, Antonio

> Hmm ok, that makes sense. Although annoying.
>We must previously set/tell Bao which channels & tones to scan.

Yes, which, by the way, is true of every radio made anywhere in the world.

The UV-5R (like nearly all scanning capable radios) will scan EITHER the specific frequencies you program into memory OR it can scan a range of frequencies.

The notion of wanting the radio to scan through all the possible tones and DCS codes would appear to indicate that you don't really understand what those tones and codes are used for.
The only purpose of setting a tone or DCS code on the receiver is to PREVENT it from hearing unwanted signals. If you want it to receive all signals on a particular frequency, you would not program any tone or code at all.
There is very rarely any reason to ever program a Receive tone or code. New users are strongly discouraged from programming receive tones or codes, because they rarely accomplish what they think they were trying to do.

No CTCSS Tone or DCS code is ever needed to receive a signal!

As others have told you, the UV-5R is quite possibly the worldÃ‚â€™s poorest excuse for a scanner. If what you want is a scanner Ã‚â€“ buy a scanner Ã‚â€“ do not buy a UV-5R which will start out by making you unhappy, followed quickly by you making all of us unhappy when you start posting about it not doing things it was never meant to do.

For example, you mention that the scan rate on the UV-5R is nominally 3 channels per second. I have never had the patience to bother clocking its glacial scan rate. I think the actual rate is slower, but letÃ‚â€™s assume that 3/sec is correct. In memory channel mode, it would then take the radio about 43 seconds to scan through the 128 memory channels

(assuming it didnÃ‚â€™t stop on random static Ã‚â€“ as it certainly will) Checking each channel at best once every 43 seconds means it will miss many transmissions entirely Ã‚â€“ and will stop on a channel in the midst of a transmission most of the time rather than having much chance of being near the start of the transmission.

In frequency mode, the radio would scan each step. With the step size set to 2.5 KHz (as it would need to be for commercial or public service
channels) the radio would take nearly 2 seconds to move from one actual frequency to the next possible frequency.

The typical scan rate of a real scanner today is 100 channels per second Ã‚â€“ with good scanners the rate can be faster.

Just a FYI to clear up something. Australian and various European countries are now using FM 'CB' using 2 meter frequency range. Some countries require a license only for their 2 meter fm 'CB' use. Basically their CB is much like our Technician class amateur radio license. I found a lot on European CB when I was studying for my tech license. Wished they had FM CB in the United States. It'd probably get more people into ham radio! And Radio Shack would carry ham radios! (Not that I would want to buy one from him)

If you're ever out of Brisbane most of regional qld police aren't digital and its really interesting to listen too. If your're looking for more frequencies

http://www.brisbanescan.com/ will be worth a look
also http://www.aussiescanners.com/forum/viewforum.php?f=89

Again it takes alot of patience but keep a note of all of the frequencies you pick up and save them for future reference. Good luck!

Find me an antenna that does or even claims to do 136MHz to 480MHz.

I've not seen a "wideband" UHF/VHF antenna yet (not that they don't exist.just haven't run across them).

In particular I hope you're not thinking the UV-5R stock antenna does that..it doesn't.

What the radio can do has absolutely nothing to do with the antennas capability.

Plus.my testing of 3 NA-771's showed considerable difference between them (4.6dB)..might be an indication of fakes.don't know for sure.

Given what you pay for these at that ebay link I wouldn't be surprised if it was a fake.

The Diamond RH771 and Powerwerx WXGAT-ST both did better than any of the NA-771's.

http://groups.yahoo.com/neo/groups/baofeng_uv5r/conversations/topics/34802

I just noticed that the web archive cuts off the email at 64kB so I'm going to have to post a PDF file to the file area.

I buyed this http://www.ebay.com/itm/NAGOYA-NA-771-SF-SMA-antenna-Wouxun-TK-2107-KGUVD1P-PX-888K-Baofeng-UV-5R-S9-/390637167048?pt=UK_Mobile_Phones_Communication_Radio_Antennas <http://www.ebay.com/itm/NAGOYA-NA-771-SF-SMA-antenna-Wouxun-TK-2107-KGUVD1P-PX-888K-Baofeng-UV-5R-S9-/390637167048?pt=UK_Mobile_Phones_Communication_Radio_Antennas&hash=item5af3ca21c8> &hash=item5af3ca21c8

Why would one discard 136-144 MHz and 400-430 of the radio's capability with such a choice?

--

Sorry, given the vendor's statement of "Frequency: 144/430MHz", that should have been:

Why would one discard 136-144 MHz and 430-480 MHz of the radio's capability with such a choice?

I just got mine the other day...I do have some experience with repeaters etc. since I also have an FT-897D.

But here is a great introductory site I found:
http://wp4aoh.blogspot.com/2013/01/uv-5re-photo-1-baofeng-uv-5r-ia-multi.html

This site will familiarize you with the basics.

I have been practicing with CHIRP and Repeater Book
http://www.repeaterbook.com/repeaters/index.php?state_id=none#sthash.pl9kU35X.dpbs
to locate the repeaters within 50 miles and then import them...it took me several times to get it right.

After loading the local ham repeaters, I loaded the GMRS repeaters (something I just discovered). Now I have the radio sitting on the table with the SCAN running...every now and then some voice will pop up.

Since I am on the Chesapeake Bay, I plan to load the VHF marine channels, too.

With CHIRP it took me a while to figure out how to add items to the existing list...basically you have to "renumber" the items you want to add so they will fall in behind the existing ones...once you figure it out, it will seem simple.

I did fire it up two evenings ago on our local repeater to get a signal report...spoke with one of the local club members who was leaves his radio on all day...great connection and I was pleased with the audio...he said I sounded very good. I was using the external speaker/mic.

Cheers,

Ed

Mike

Just wanted to let you know that Smiley sent me yet a third connector for my antenna to try. The first two were the same, this one is different. The contact and "teflon" are almost at the leading face of the connector, where as in the previous ones, it was recessed into the fitting. Perhaps this will allow better/more contact with the male pin. Not sure I have time to do any testing since I am going in for surgery this week. But when things are back to normal, I will let you know.

Tnx

Tony

I noted the 15dB gain when holding the radio away from you.
So yes….that does help immensely…and it's free!

And yes the measurements are relative to S9=0dB rather than dBm.
But just subtract 73 dB if you want dBm measurements (i.e. S9=-73dB instead of S9=0dB)

Mike, very interesting stuff.

Related to the comment below, couldnt a remote mike help in the situation, where you hold the HT with one hand and talk into the remote mike in the other??

BTW, these DB ratings are "relatve" and not actual correct??

Tony

But…the closer you put the antenna to your face the more power you lose so my ability to absolutely duplicate the exact conditions is limited just a bit.

I want to put this out there while I finish writing this up and do the UHF testing.

W9MDB VHF test conducted 10/5/2013 1030-1200 in Quincy IL. Weather was sunny
Receiver was IC-706MKIIG calibrated at 146MHz with Elecraft XG3 and MFJ-762 attenuator at S9=0dB
S Meter Lite version 2.23 displayed calibrated dB units
Webcam watched home computer screen while transmitting from remote location and watching webcam for dB results
Distance 2.05 miles
UV-5R used while sitting in chair, held approx 2 inches from face
Note: Obtained 15dB gain with A-V85 by moving antenna 12" from face and using external mic

Black text is regular antennas, Red is extendables, Cyan is mobiles.

34861. RE: [baofeng_uv5r] RE: Antenna Testing

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-07 14:49:53 UTC
From: Michael Black
Topic: 34802 Message: 34861

The antenna most people get with their UV-5R's is the "A-5R logo". I'll put a note on it for my PDF version to show it's the more popular antenna provide.

I'll note that threeoldcrows ships the A-V85 with all their radios.

The web link for this thread cuts off the list but the A-5R does show in this email thread. It didn't exactly perform well which is pretty well known already….but since it's the only ~5" one it may be in the ballpark for its size.

Subject: [baofeng_uv5r] RE: Antenna Testing

Mike, another question.....where in the testing are the "regular" Baofeng antennas?? Is the data cut off??

Tony

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

I noted the 15dB gain when holding the radio away from you.

So yes….that does help immensely…and it's free!

And yes the measurements are relative to S9=0dB rather than dBm.

But just subtract 73 dB if you want dBm measurements (i.e. S9=-73dB instead of S9=0dB)

Mike W9MDB

Subject: Re: [baofeng_uv5r] Antenna Testing

Mike, very interesting stuff.

Related to the comment below, couldnt a remote mike help in the situation, where you hold the HT with one hand and talk into the remote mike in the other??

BTW, these DB ratings are "relatve" and not actual correct??

Tony

But…the closer you put the antenna to your face the more power you lose so my ability to absolutely duplicate the exact conditions is limited just a bit.

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@...m] On Behalf Of Michael Black
Sent: Sunday, October 06, 2013 5:11 AM

Subject: [baofeng_uv5r] Antenna Testing

I want to put this out there while I finish writing this up and do the UHF testing.

W9MDB VHF test conducted 10/5/2013 1030-1200 in Quincy IL. Weather was sunny

Receiver was IC-706MKIIG calibrated at 146MHz with Elecraft XG3 and MFJ-762 attenuator at S9=0dB

S Meter Lite version 2.23 displayed calibrated dB units

Webcam watched home computer screen while transmitting from remote location and watching webcam for dB results

Distance 2.05 miles

UV-5R used while sitting in chair, held approx 2 inches from face

Note: Obtained 15dB gain with A-V85 by moving antenna 12" from face and using external mic

Black text is regular antennas, Red is extendables, Cyan is mobiles.

Actually, there is one service in the US that it is legal to use a modified ham transceiver; the Military Auxiliary Radio Service, and it used to be legal to use for the Civil Air Patrol.

From: <wv8a@...>
Topic: 34431 Message: 34863

A "dual-band" antenna is engineered and spec'ed to perform best as both a receive and transmit antenna on the 144-148MHz (2M) band, and also the 420-450 (70cm) band. This is not the same as a "wideband" antenna (e.g. 144 _to_ 450), which is pretty much a piece of stiff wire that happens to intercept signals across a wide range of frequencies, and may not serve very well as a transmitting antenna (except near the frequency it's resonant at). Most Scanner antennas are in this category, where there's not the worry of having to always present proper impedance match to a transmitter's critical final amplifier.

Isn't that FRS?

RS did sell some ham stuff years ago. There were a series of single band and dual band HTs made by other companies and badged as RS. The single band units had fairly tight front ends because they didn't go out of band at all. Not as cheap as the Baofeng though.

Hi all, i wish to build a small repeater with two uv-5r...

my question is do i need any repeater controller box for the two handy connection?

or maybe i can just connect the two handy like using two normal audio jack cable?

2.5mm(speaker)to3.5mm(mic)directly connect,and on the VOX for the ptt transmit?

That is one way to skin a cat! Not the preferred or true method, but if you arent trying for anything that can actualy do the job then sure, this method will work! You are going to want a big cavity to tune with, and once setup it is leave it alone, repeaters dont work well when they have to be tuned every other minute because you changed frequency.

Now if you want to do cross band repeat then the method you describe is one way that sort of works, but the radios themselves wont handle the TX time for most good ragchews. the Boefang are not a good rig for use as a repeater in general. there is no way to control the levels of noise in and out of the things.

I have yet to receive any transmissions on my unit and I will be loading in frequencies once I get my programming usb cable.

The factory supplied channels are for factory testing only. I wouldn't expect to hear anything on any of them. You need to find frequencies in your area and program them in. I would start off by keying in the weather radio frequency for your area into one of the VFOs. It broadcasts 24/7 so you should receive it any time night or day.

I was hoping someone could point me in the right direction on how to set up my unit - there are a lot of settings I know nothing about.

Visit the Miklor.com website. On the UV-5R home page look for Menu Detailed Reference. It will have links to the Reference for UV-5R Menus. This guide tries to explain all if the menu and suggest settings for some of the more obscure ones.

There are many posts on updating my firmware (BFB297) is this necessary for me to be able to use the unit properly?

There are no posts on updating the firmware. It can't be done. The chip with the firmware is a One Time Programmable chip and the one time was done in the factory. There has not been enough difference between firmware versions to concern yourself with which one you get. You can be fairly certain that if the [3] + Power-on firmware message is BFB-297, you do not have BFB297. All firmware versions newer then BFB297 all masquerade as BFB297. You have to use CHIRP to find out what the 'real' firmware version is. Once again, there is no need to be concerned about the firmware version because the differences between them have been mostly transparent to the radio user.

my main objective is to be able to listen in on frequencies (police, fire, taxi, etc) but I have no idea on how to achieve this.

Then you need to get a programming cable so that every channel that you program has TX inhibited.

Im sure there must be posts for people like me who know very little about all this.

Yes. This is true.

Thanks

You wont find a weather radio frequency for Brisbane. Jim is referring to a weather frequency that is a feature of life in the USA but not in Australia. I suggest you enter a common UHF CB frequency and listen out on that, or better yet, get somebody with a UHF radio transmit on it so you know there is a signal you should be able to copy.

From: Xaun Loc
Topic: 34738 Message: 34880

Glad I was able to help. The UV-5R is a fine little radio for communications. In fact, it is an absolutely great radio - for the price - but it does have some limitations.

My experience is that SAR operations typically only use one or two frequencies at a time on any specific search. Depending on the particular SAR Team, they may be using a dedicated SAR frequency, or a licensed commercial or public service frequency, or a ham frequency -- or perhaps some combination. In a large search, there may be several other frequencies of interest due to other agencies being involved.

For example on a large search, there will probably be a real SAR Team, plus volunteers, plus the local Sheriff's Department, and possibly several nearby police departments. Even if the SAR Team has its own radios licensed on a SAR frequency, the volunteers will probably be supported by ham radio operators, and of course the Sheriff's deputies and police will all be operating on their own frequencies. To catch ALL the action, you would probably need a real scanner (depending on where you live, you might need a scanner capable of monitoring trunked radio systems and/or APCO 25 digital systems). But if you settle for the two most significant frequencies, you can program those two frequencies into the A & B VFOs and set the radio to Dual Watch so that it just scans between the two frequencies displayed. When the radio is only scanning between two channels you won't miss nearly as much.

-----Original Message-----
From: Loureiro, Antonio

Thanks Xaun, that was really helpful.

My first intended use for my radio is actually communication during search/rescue and emmergency (mountain) scenarios
The info you gave me actually helped - by simple math/time - how I'd rather set my scanning option [freq range] over the freqs each area uses for emmergency services, NO TONE, and I now what to expect when it comes to freq search cycle.

> Find me an antenna that does or even claims to do 136MHz to 480MHz.

Not hard at all.

A log-periodic could be built to do the job; but a simple discone would
usually be more useful due to its omnidirectional pattern.

Actually you can put both of those into the past tense.

Yes, MARS has been dragging its feet on the long-established requirement for NTIA compliance - but the requirement was established already and all the postponed deadlines have long past.

From: Matthew Pitts

Actually, there is one service in the US that it is legal to use a modified ham transceiver; the Military Auxiliary Radio Service, and it used to be legal to use for the Civil Air Patrol.

Sent: Monday, October 07, 2013 01:06
Subject: Re: [baofeng_uv5r] Band changed to 220

If it is just one bit (isn't that one byte) could it be corruption from things like background radiation. In home computers ram gets corrupted all the time from gamma rays occasionally interacting with a single bit causing it to flip. Not sure if that is likely in non-volatile memory. Anyway its why servers use memory with a parody bit to help catch single bit errors.

Jim Unroe <rock.unroe@...> wrote:

On Sun, Oct 6, 2013 at 7:19 PM, <radio.wa5km@...> wrote:

I used chirp to program my UV5RA but it changed my second band to 220 MHZ ! I never tried to do anything like this and it does not put out RF but it rejects any 440 type freqs I try to key in. I did a reset per the menu and it is still the same. Anyone have any ideas?

CHIRP looks at one byte to determine if the image file is for a VHF/UHF radio or a VHF/220 radio. CHIRP does not manipulate this byte itself, so this byte got changed some other way.

The only way that I can think of for changing this byte would be by messing around with the options in the Other menu of the VIP software. Another would be by loading in an image file that was originally from a VHF/220 radio. If there is another way, I would be interested in knowing what it was.

This can easily be fixed. I was waiting on you to provide you firmware version so I could provide more specific instructions.

Another alternative would be for you to email me your CHIRP image and I will email it back with the necessary changes. uv5r [at] kc9hi [dot] net

Thanks for the feedback. i guess Part 87 has to do with marine compliance...I go out on CG Auxiliary patrols on the Chesapeake Bay...we have the standard marine VHF radios...but there is no harm in bringing one of these along as a back-up...in an emergency no one would be asking whether the radio was compliant or not.

You mention changing the names to something more user friendly...can we actually name the channels on the UV-5R? I just thought we were limited to the frequency showing on the window? How do we enter an alphanumeric name for a frequency or channel?...I didn't see anything in the manual.

Cheers,

Ed

(trimmed)

You need to put these channels in as min

16

9

22

68

72

(trimmed)

Let me go a little further.

Add Marine Ch 13. In Gulf of Mexico, Ch 13 for ship to shorebase in port, as well as channel traffic.

Marine Ch 16 International Distress, Safety and Calling. Ships required to carry radio, USCG, and most coast stations maintain a listening watch on this channel. (In Gulf of Mexico, Ch 16 for offshore)

Marine Ch 9 Boater Calling. Commercial and Non-Commercial.

Marine Ch 22A Note the correction, 22A. Should there be an actual emergency heard on Ch 16, the Coast Guard will direct you to switch to Ch. 22A and work the emergency on that frequency.

Marine Ch, 68 and 72 are non-commercial ship to ship and ship to shorebase.

Via Chirp, I simply name these channesl MAR9, MAR13, MAR16, etc.

Paul - AE5JU

Yes I know it is not Part 87 certified, but if the main radio fails or you fall overboard (with your unit on in the bag) or have to abandon ship I’ll take the chance.

You need to put these channels in as min

16

9

22

68

72

Also change the Chirp names to Channels that are more user friendly Ex MVHS16....MVHS22..

I also suggest getting the water-proof bag too.

Subject: [baofeng_uv5r] Re: new to ham radio/baofeng

I just got mine the other day...I do have some experience with repeaters
etc. since I also have an FT-897D.

But here is a great introductory site I found:
http://wp4aoh.blogspot.com/2013/01/uv-5re-photo-1-baofeng-uv-5r-ia-multi.html

This site will familiarize you with the basics.

I have been practicing with CHIRP and Repeater Book
http://www.repeaterbook.com/repeaters/index.php?state_id=none#sthash.pl9kU35X.dpbs
to locate the repeaters within 50 miles and then import them...it took
me several times to get it right.

After loading the local ham repeaters, I loaded the GMRS repeaters
(something I just discovered). Now I have the radio sitting on the table
with the SCAN running...every now and then some voice will pop up.

Since I am on the Chesapeake Bay, I plan to load the VHF marine
channels, too.

With CHIRP it took me a while to figure out how to add items to the
existing list...basically you have to "renumber" the items you want to
add so they will fall in behind the existing ones...once you figure it
out, it will seem simple.

I did fire it up two evenings ago on our local repeater to get a signal
report...spoke with one of the local club members who was leaves his
radio on all day...great connection and I was pleased with the
audio...he said I sounded very good. I was using the external speaker/mic.

Cheers,

Ed

34894. BAOFENG UV5R-S

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-08 03:18:54 UTC
From: Bob Clabaugh
Topic: 34431 Message: 34894

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I'm in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven't got the repeater fully working yet so I can't test out the 1.25M features of the radio. There aren't many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it's a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I've read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

Hi Bob,
What is the firmware version (power on while pressing the 3 key)? All of the VHF/220 radios that I know about have all had even numbered firmware (BFB296, BFB298, etc) where the late model VHF/UHF radios all have odd numbered firmware (BFB297, BFB299, etc).

I use the frequency as the name for the repeaters I use the most, for the outlying areas I usually use a location name, sometimes the call sign of the owner
It is not that hard to switch the setting from name to freq, etc. this way, you still have 128 memories instead of 64.

Actually, Jim, Class D CB in the US has had SSB available a LOT longer than just 20 years -- but the vast majority of actual Class D CB operation is still AM. SSB is popular with a tiny fraction of operators - most of whom spend their time illegally operating between 27.410 and 27.990

> Im beginning to think that ive bought and expensive
> FM radio cause that is all I seem to be able to listen to :-(

That MAY well be true.

IF you continue to choose not to read and follow the information provided on the Miklor website.

Many people here have patiently answered your questions, but there is no indication that you are taking advantage of the answers they have provided.

PART of the problem seems to be that you decided to buy the radio without any understanding of what it is or how to use it. Unfortunately that isn't really very unusual. We regularly see new users here who lack the basic knowledge to ask appropriate questions and understand the answers. There are always people who lose patience with such users; but there are also many people who will continue to try to help any new user who actually wants help -- but you need to be willing to accept the help that is available.

Go right ahead. That will be at least one less UV-5R on the air in the hands of someone who should not have a radio.

From: dk0164988860@...

Hi all, i wish to build a small repeater with two uv-5r...

my question is do i need any repeater controller box for the two handy connection?

or maybe i can just connect the two handy like using two normal audio jack cable?

2.5mm(speaker)to3.5mm(mic)directly connect,and on the VOX for the ptt transmit?

Hi Paul,

I was just messing with loading the VHF marine channels and noticed there is a big discrepancy between the CHIRP listing and this site http://www.navcen.uscg.gov/?pageName=mtvhf

The CHIRP listing doesn't go up to 23A, which is our CGAUX contact channel.

Do you know anything about this?

Also, can we rename the channels in the UV-5R?

Cheers,

Ed

(trimmed)

You need to put these channels in as min

16
9
22
68
72

(trimmed)

Let me go a little further.

Add Marine Ch 13. In Gulf of Mexico, Ch 13 for ship to shorebase in port, as well as channel traffic.

Marine Ch 16 International Distress, Safety and Calling. Ships required to carry radio, USCG, and most coast stations maintain a listening watch on this channel. (In Gulf of Mexico, Ch 16 for offshore)

Marine Ch 9 Boater Calling. Commercial and Non-Commercial.

Marine Ch 22A Note the correction, 22A. Should there be an actual emergency heard on Ch 16, the Coast Guard will direct you to switch to Ch. 22A and work the emergency on that frequency.

Marine Ch, 68 and 72 are non-commercial ship to ship and ship to shorebase.

Via Chirp, I simply name these channesl MAR9, MAR13, MAR16, etc.

Paul - AE5JU

There are 128 memories available for programming in the UV-5R family of radios.

Each line of the main display is an independent view of all memories that have been programmed (up to 128). Setting one line to display the memories using the NAME format and setting the other line to display the memories using the FREQuency format in no way affects the number of memories that are available to be programmed or the number of memories that are available in either line of the display.

If 99 memory channels have been programmed, then the top line has access to all 99 of these memories and will show them using the Memory Display Format (MDF) that has been selected for MDF-A (CHannel number, NAME or FREQuency). The bottom line has access to the same 99 memory channels and they will be shown in the MDF that has been selected for MDF-B.

There is nothing wrong with setting a memory's NAME to the frequency (or channel number). But as mentioned, "It is not hard to switch the setting from name to freq, etc."

You probably can't. It does help to keep it upright, but the radio is not very selective so it picks up signals from all manner of electronic devices. Hey what do you want from a $50 radio?

1. Is the battery fully charged when this happens?

2. What other electronic equipment do you have in the immediate vicinity of the radio when this happens?

It MAY be picking up noise that is JUST under the squelch threshold of the radio, which means that occasional spikes will be over the squelch threshold and the radio will open the speaker for those. The test is simple. Turn the radio off, walk outside, well away from any buildings and electronics (leave your cellphone inside or in your car!), turn it on, and see if it still does it.

If it doesn’t misbehave when it is well away from other electronics (especially PCs and cellphones), the fix is simple enough: turn up the squelch.

Find a modern CB with SSB capability. I tried to buy one when I bought my last cb, you have 2 options. No SSB, or an import cb that is technically illegal for use in the USA because it allows more power and is generally a 10 meter radio modified for cb.

"I usually program line A (top line) with user friendly alpha tags and line B frequencies. "using the front panel keypad, go into menu mode into you find MDF-A then select name this will give you the same thing I have.

"I suggest keeping line A names and line B frequency, the reason for this is to check the op frequency of your channel memory location."

I have found no utility in using the freq. Ask anyone on water what the frequency is for Marine Ch. 22A, they don't know and don't care. It doesn't matter except when you program in the channel.

Same with repeaters. I care where the repeaters are located so I can use one in my vicinity. I don't care its frequency. So I name it accordingly.

Also, when you do put freq on one line, name on the other, many people are confused and don't understand why when they change channels the frequency does not change, or vice versa.

If you need to know frequency it is easy to change menus 21 and 22.

Paul - AE5JU

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

I usually program line A (top line) with user friendly alpha tags and line B frequencies.

using the front panel keypad, go into menu mode into you find MDF-A then select name this will give you the same thing I have.

I suggest keeping line A names and line B frequency, the reason for this is to check the op frequency of your channel memory location.

For example I have channel memory spot 46 set to default 70 cm CALL frequency. So on memory location 46 on line A it will say “70 CM CA to verify this is a correct frequency I can then go to line B set that to the same memory location “46” and get that frequency of 446.000 in the display.

This helps prevent errors when you have both lines setup this way as you can insure the alpha tag in that memory location is indeed set to the correct frequency.

user step

Menu <menu voice>
scroll using up/down keys until you see MDF-A
press Menu again <beep with a left arrow jump to line B display>
using the up/down keys again scroll until you see name, <3 choices are freq, channel and name>

Once name is selected hit MENU again <voice says Confirmed>
Exit

Line A is now names and B is frequencies.

Enjoy

Thanks for the feedback. i guess Part 87 has to do with marine compliance...I go out on CG Auxiliary patrols on the Chesapeake Bay...we have the standard marine VHF radios...but there is no harm in bringing one of these along as a back-up...in an emergency no one would be asking whether the radio was compliant or not.

You mention changing the names to something more user friendly...can we actually name the channels on the UV-5R? I just thought we were limited to the frequency showing on the window? How do we enter an alphanumeric name for a frequency or channel?...I didn't see anything in the manual.

Cheers,

Ed

> Find me an antenna that does or even claims to do 136MHz to 480MHz.

Not hard at all.

A log-periodic could be built to do the job; but a simple discone would usually be more useful due to its omnidirectional pattern.

Don’t pay much, if any, attention to the “gain” of an antenna – it’s barely in the ballpark as far as performance goes.

Those are theoretical numbers. The 660 is 6” longer than the 770 so the idea it performed better doesn’t surprise me at all.

Plus I’m only testing the center freq on VHF and the antenna SWR will affect this too. I’m considering doing 2 other freqs too to better see the real in-use SWR behavior and better band coverage.

You also need to remember that gain is the max gain…it doesn’t tell you the takeoff angle for that gain. I held the antenna vertically and did not try and find the best slice for each antenna…since normally one would have no idea.

As you can see from my testing you do end up with general categories based on length…

Propagation on my test was not line of sight as there’s some ground in the way between the points so that’s why the levels are as low as they are for just 2 miles

Mike W9MDB.

Good Job,

Thanks for doing the test. Interesting, I will focus on the RH771’s as my prime antenna as the recommended version.

I also found it interesting the Rh 660 was better than the heavier RH 770 as the 770 is supposed to have a 5.5Db gain compared to the 5 Db gain of the 660.

These telescopics are heavy for this HT but make great bug-out-bag antennas if needed.

Subject: RE: [baofeng_uv5r] RE: Nagoya Dual Band SMA UV Antenna

Find me an antenna that does or even claims to do 136MHz to 480MHz.

I’ve not seen a “wideband” UHF/VHF antenna yet (not that they don’t exist…just haven’t run across them).

In particular I hope you’re not thinking the UV-5R stock antenna does that….it doesn’t.

What the radio can do has absolutely nothing to do with the antennas capability.

Plus…my testing of 3 NA-771’s showed considerable dif ference between them (4.6dB)….might be an indication of fakes…don’t know for sure.

Given what you pay for these at that ebay link I wouldn’t be surprised if it was a fake.

The Diamond RH771 and Powerwerx WXGAT-ST both did better than any of the NA-771’s.

http://groups.yahoo.com/neo/groups/baofeng_uv5r/conversations/topics/34802

I just noticed that the web archive cuts off the email at 64kB so I’m going to have to post a PDF file to th e file area.

I buyed this http://www.ebay.com/itm/NAGOYA-NA-771-SF-SMA-antenna-Wouxun-TK-2107-KGUVD1P-PX-888K-Baofeng-UV-5R-S9-/390637167048?pt=UK_Mobile_Phones_Communication_Radio_Antennas <http://www.ebay.com/itm/NAGOYA-NA-771-SF-SMA-antenna-Wouxun-TK-2107-KGUVD1P-PX-888K-Baofeng-UV-5R-S9-/390637167048?pt=UK_Mobile_Phones_Communication_Radio_Antennas&hash=item5af3ca21c8> &hash=item5af3ca21c8

Why would one discard 136-144 MHz and 400-430 of the radio's capability with such a choice?

--

Sorry, given the vendor's statement of "Frequency: 144/430MHz" ;, that should have been:

Why would one discard 136-144 MHz and 430-480 MHz of the radio's capability with such a choice?

We have the UV-5RA and RC in a 220MHz version we label it the RAX and RCX

They are available from our web site and are unique to our company

You cannot do a software mod on a 144/440 and get it to work on 220MHz,

Hi, Ed! Yes, here is a more complete listing of Marine channels. I don't remember where I got this, but it has good descriptions of the usage of each channel.

Yes, I live in a port city on the Gulf Coast, and our club station is just two very short blocks from the waterfront.

Paul - AE5JU

Channel Ship Ship Use

Number Transmit Receive

01A 156.050 156.050 Port Operations and Commercial.

VTS in selected areas.

05A 156.250 156.250 Port Operations. VTS in Seattle

06 156.300 156.300 Intership Safety

07A 156.350 156.350 Commercial

08 156.400 156.400 Commercial (Intership only)

09 156.450 156.450 Boater Calling. Commercial and Non-Commercial.

10 156.500 156.500 Commercial

11 156.550 156.550 Commercial. VTS in selected areas.

12 156.600 156.600 Port Operations. VTS in selected areas.

13 156.650 156.650 Intership Navigation Safety

(Bridge-to-bridge). Ships >20m

length maintain a listening watch

on this channel in US waters.

(In Gulf of Mexico, Ch 13 for ship to shorebase in port and in river traffic)

14 156.700 156.700 Port Operations. VTS in selected areas.

15 -- 156.750 Environmental (Receive only). Used

by Class C EPIRBs.

16 156.800 156.800 International Distress, Safety and

Calling. Ships required to carry

radio, USCG, and most coast

stations maintain a listening watch

on this channel.

(In Gulf of Mexico, Ch 16 for offshore)

17 156.850 156.850 State Control

18A 156.900 156.900 Commercial

19A 156.950 156.950 Commercial

20 157.000 161.600 Port Operations (duplex)

20A 157.000 157.000 Port Operations

21A 157.050 157.050 U.S. Government only

22A 157.100 157.100 Coast Guard Liaison and Maritime

(this channel is called "Twenty Two Alpha" and is kept clear but for actual emergencies)

Safety Information Broadcasts.

Broadcasts announced on channel 16.

23A 157.150 157.150 U.S. Government only

24 157.200 161.800 Public Correspondence (Marine Operator)

25 157.250 161.850 Public Correspondence (Marine Operator)

26 157.300 161.900 Public Correspondence (Marine Operator)

27 157.350 161.950 Public Correspondence (Marine Operator)

28 157.400 162.000 Public Correspondence (Marine Operator)

63A 156.175 156.175 Port Operations and Commercial.

VTS in selected areas.

65A 156.275 156.275 Port Operations

66A 156.325 156.325 Port Operations

67 156.375 156.375 Commercial. Used for Bridge-to-bridge communications in lower

Mississippi River. Intership only.

68 156.425 156.425 Non-Commercial

69 156.475 156.475 Non-Commercial

70 156.525 156.525 Digital Selective Calling (voice communications not allowed)

71 156.575 156.575 Non-Commercial

72 156.625 156.625 Non-Commercial (Intership only)

73 156.675 156.675 Port Operations

74 156.725 156.725 Port Operations

77 156.875 156.875 Port Operations (Intership only)

78A 156.925 156.925 Non-Commercial

79A 156.975 156.975 Commercial

80A 157.025 157.025 Commercial

81A 157.075 157.075 U.S. Government only - Environmental protection operations.

82A 157.125 157.125 U.S. Government only

83A 157.175 157.175 U.S. Government only

84 157.225 161.825 Public Correspondence (Marine Operator)

85 157.275 161.875 Public Correspondence (Marine Operator)

Hi Paul,

I was just messing with loading the VHF marine channels and noticed there is a big discrepancy between the CHIRP listing and this site
http://www.navcen.uscg.gov/?pageName=mtvhf

The CHIRP listing doesn't go up to 23A, which is our CGAUX contact channel.

Do you know anything about this?

Also, can we rename the channels in the UV-5R?

Cheers,

Ed

(trimmed)

You need to put these channels in as min

16
9
22
68
72

(trimmed)

Let me go a little further.

Add Marine Ch 13. In Gulf of Mexico, Ch 13 for ship to shorebase in port, as well as channel traffic.

Marine Ch 16 International Distress, Safety and Calling. Ships required to carry radio, USCG, and most coast stations maintain a listening watch on this channel. (In Gulf of Mexico, Ch 16 for offshore)

Marine Ch 9 Boater Calling. Commercial and Non-Commercial.

Marine Ch 22A Note the correction, 22A. Should there be an actual emergency heard on Ch 16, the Coast Guard will direct you to switch to Ch. 22A and work the emergency on that frequency.

Marine Ch, 68 and 72 are non-commercial ship to ship and ship to shorebase.

Via Chirp, I simply name these channesl MAR9, MAR13, MAR16, etc.

Paul - AE5JU

Yes I know it is not Part 87 certified, but if the main radio fails or you fall overboard (with your unit on in the bag) or have to abandon ship I’ll take the chance.

You need to put these channels in as min

16
9
22
68
72

Also change the Chirp names to Channels that are more user friendly Ex MVHS16....MVHS22..

I also suggest getting the water-proof bag too.

Subject: [baofeng_uv5r] Re: new to ham radio/baofeng

I just got mine the other day...I do have some experience with repeaters etc. since I also have an FT-897D.

But here is a great introductory site I found:
http://wp4aoh.blogspot.com/2013/01/uv-5re-photo-1-baofeng-uv-5r-ia-multi.html

This site will familiarize you with the basics.

I have been practicing with CHIRP and Repeater Book
http://www.repeaterbook.com/repeaters/index.php?state_id=none#sthash.pl9kU35X.dpbs
to locate the repeaters within 50 miles and then import them...it took me several times to get it right.

After loading the local ham repeaters, I loaded the GMRS repeaters (something I just discovered). Now I have the radio sitting on the table with the SCAN running...every now and then some voice will pop up.

Since I am on the Chesapeake Bay, I plan to load the VHF marine channels, too.

With CHIRP it took me a while to figure out how to add items to the existing list...basically you have to "renumber" the items you want to add so they will fall in behind the existing ones...once you figure it out, it will seem simple.

I did fire it up two evenings ago on our local repeater to get a signal report...spoke with one of the local club members who was leaves his radio on all day...great connection and I was pleased with the audio...he said I sounded very good. I was using the external speaker/mic.

Cheers,

Ed

Paul,

Thanks for the feedback...

Big question here is how do we get this list into the UV-5R? This is the list I want to have...not the one in CHIRP.

I hope we don't have to do it manually...if that is necessary, I will only put in a few of the channels that we would use on CGAUX patrols.

Cheers,

Ed

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.
In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Subject: [baofeng_uv5r] BAOFENG UV5R-S

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

Jardy,

We already have at least two marine radios on the boats when we are on Coast Guard Auxiliary patrol...

I was thinking to bring the UV-5R along as an emergency back-up to them.

The question was how to upload the standard list at http://www.navcen.uscg.gov/?pageName=mtvhf into the radio...the list that CHIRP offers is very different and doesn't even include channel 23A which is the one we use to report to the Coast Guard while on patrol.

Cheers,

Ed

You can get an img file with what looks like all the channels from w6aux's web page:

http://w6aux.blogspot.com/2013/03/new-post.html

Mike W9MDB

Subject: Re: [baofeng_uv5r] Re: new to ham radio/baofeng

Jardy,

We already have at least two marine radios on the boats when we are on Coast Guard Auxiliary patrol...

I was thinking to bring the UV-5R along as an emergency back-up to them.

The question was how to upload the standard list at http://www.navcen.uscg.gov/?pageName=mtvhf into the radio...the list that CHIRP offers is very different and doesn't even include channel 23A which is the one we use to report to the Coast Guard while on patrol.

Cheers,

Ed

You could get a marine band radio.

Jardy Dawson

WA7JRD

Sent using sidewalk chalk.

On Oct 8, 2013, at 8:23, Ed Plaisance <plaisaeb@...> wrote:

Paul,

Thanks for the feedback...

Big question here is how do we get this list into the UV-5R? This is the list I want to have...not the one in CHIRP.

I hope we don't have to do it manually...if that is necessary, I will only put in a few of the channels that we would use on CGAUX patrols.

Cheers,

Ed

The CHIRP listing doesn't go up to 23A, which is our CGAUX contact channel.

Do you know anything about this?

Also, can we rename the channels in the UV-5R?

Cheers,

Ed

(trimmed)

You need to put these channels in as min

16

9

22

68

72

(trimmed)

Let me go a little further.

Add Marine Ch 13. In Gulf of Mexico, Ch 13 for ship to shorebase in port, as well as channel traffic.

Marine Ch 16 International Distress, Safety and Calling. Ships required to carry radio, USCG, and most coast stations maintain a listening watch on this channel. (In Gulf of Mexico, Ch 16 for offshore)

Marine Ch 9 Boater Calling. Commercial and Non-Commercial.

Marine Ch 22A Note the correction, 22A. Should there be an actual emergency heard on Ch 16, the Coast Guard will direct you to switch to Ch. 22A and work the emergency on that frequency.

Marine Ch, 68 and 72 are non-commercial ship to ship and ship to shorebase.

Via Chirp, I simply name these channesl MAR9, MAR13, MAR16, etc.

Paul - AE5JU

Yes I know it is not Part 87 certified, but if the main radio fails or you fall overboard (with your unit on in the bag) or have to abandon ship I’ll take the chance.

You need to put these channels in as min

16

9

22

68

72

Also change the Chirp names to Channels that are more user friendly Ex MVHS16....MVHS22..

I also suggest getting the water-proof bag too.

Subject: [baofeng_uv5r] Re: new to ham radio/baofeng

I just got mine the other day...I do have some experience with repeaters
etc. since I also have an FT-897D.

But here is a great introductory site I found:
http://wp4aoh.blogspot.com/2013/01/uv-5re-photo-1-baofeng-uv-5r-ia-multi.html

This site will familiarize you with the basics.

I have been practicing with CHIRP and Repeater Book
http://www.repeaterbook.com/repeaters/index.php?state_id=none#sthash.pl9kU35X.dpbs
to locate the repeaters within 50 miles and then import them...it took
me several times to get it right.

After loading the local ham repeaters, I loaded the GMRS repeaters
(something I just discovered). Now I have the radio sitting on the table
with the SCAN running...every now and then some voice will pop up.

Since I am on the Chesapeake Bay, I plan to load the VHF marine
channels, too.

With CHIRP it took me a while to figure out how to add items to the
existing list...basically you have to "renumber" the items you want to
add so they will fall in behind the existing ones...once you figure it
out, it will seem simple.

I did fire it up two evenings ago on our local repeater to get a signal
report...spoke with one of the local club members who was leaves his
radio on all day...great connection and I was pleased with the
audio...he said I sounded very good. I was using the external speaker/mic.

Cheers,

Ed

Mike,

I think you have found what I was looking for...actually more channels
than I need, but that is not a problem...I can edit the file before
uploading.

Cheers,

Ed

I tried the driver you linked to, and every variation of installing and rebooting and plugging and unplugging I could think of. Is it 9600/8/n/1/n on the COM settings, or something different?

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.
In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Subject: [baofeng_uv5r] BAOFENG UV5R-S

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

OK, uninstalled everything again and this time did a clean shutdown at EVERY step of things. Now I have it working with CHIRP, but the BF5R program won't work at all (either the one that came with it or the latest download). Not a problem, since CHIRP seems to have a better interface anyway!

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

In addition please answer the following:

#1 Where did you buy your radio?
#2 Where did you buy your cable?
#3 It is a Prolific cable?
#4 Did you disable updates?
#5 Did you double-check that 3.2.0.0 is the installed version?

It seems that when people buy the cable from the right place they have very few problems. I've got an FTDI cable that works just fine and avoids the problems with the Prolific.
Got it from here:
http://threeoldcrows.com/shop/magento/ham-radio-equipment/accessories/programming-cable-for-kenwood-baofeng-wouxun-radios-usb-to-type-k-2-pin-connector.html http://threeoldcrows.com/shop/magento/ham-radio-equipment/accessories/programming-cable-for-kenwood-baofeng-wouxun-radios-usb-to-type-k-2-pin-connector.html

You need to ensure the cable is plugged in all the way…some people have to trim it to get it to seat correctly…especially with the cheap cables.
Or….you have a bad cable….
Or…you have a bad radio…
Or…you have a bad computer (highly unlikely)

Jim,
The driver you need is the one Mike described. A driver Newer than Prolific 3.2.0.0 will not work.
Take a look at the Miklor.com CHIRP page http://www.miklor.com/COM/UV_CHIRP.php http://www.miklor.com/COM/UV_CHIRP.php
Make sure you review the Driver FAQ section of http://www.miklor.com/COM/UV_Drivers.php#faq http://www.miklor.com/COM/UV_Drivers.php#faq
If it still doesn't work, let us know what the error messages are and describe exactly the steps you are taking. http://www.miklor.com/uv5r/UV5R-ErrorMess.php http://www.miklor.com/uv5r/UV5R-ErrorMess.php

Report back and let us know the result.

That is not true in every jurisdiction. We have people from all over the world on this forum. Just because many people here fall under the jurisdiction of the FCC does not make their rules a universal truth.

That's not true. Many people have.

That doesn't make it legal.

Just because people do things doesn't make it right, they just
didn't get caught.

Hi all,

In the past, I have successfully programmed my Baofeng UV-5R+ with both the CHIRP software and the manual programming on the radio. Recently, after using CHIRP software, I wanted to program a new repeater in manually while in the field. It didn't work. I tried multiple times, and it always told me on menu number 27 "transmitting memory", but never receiving memory. Also, when I went to channel mode and checked to see if anything worked, it still showed the value I had last put in using CHIRP. Any thoughts as to why this is and how to fix it would be greatly appreciated.

Thanks,
KC1AEJ

The UV5, like some other Chinese radios, only allow for changing the transmit parameters of a programed memory channel. In other words, you can change the transmit frequency (along with the tone options - if entered along with the transmit frequency), but if you want to write over an existing memory channel, you must first delete that channel and THEN reprogram as you normally would.

Details can be found at the miklor site.

Thanks. I forgot to mention that.

All firmware versions for the VHF/UHF UV-5R after BFB297 all report BFB297.
So you need to use one of the later daily builds of CHIRP to see the 'real'
firmware version.

> Which driver version did you end up installing? I have found that when an unauthorized copy of a Prolific USB-to-serial chip is involved, the V3.3.2.105 is the latest driver that you can successfully instal to work with the chip. CHIRP will work fine with this setup but the Baofeng software won't. To get the Baofeng software to work you have to downgrade to V3.2.0.0. That is why we typically recommend that version (it is the latest version that works with both programs and also with Windows Vista, 7 and 8.

Hi to those trying to help. I have read all the things about not being to use the regular HT on 220 and in fact I DONT WANT TO. I simply downloaded a list of my repeaters etc from CHIRP and it takes the channels but the default for band 2 is now 220. I put a frequency counter near the radio and it showed no output so it just thinks it is on 220. When 440.000 is keyed in it errors and goes back to 220. I am looking up how to get the firmware readout.

Ken,

This won't take long to fix. So far you have ignored both of my posts. This could have been taken care of in a few minutes on the first day. We can't help you if you won't let us.

Send me your CHIRP image and I will return it to you fixed. uv5r [at] kc9hi [dot] net

Topic: 34969 Message: 34969

Hello

I am a new ham having just received my license 2 weeks ago. It only took me 25 years to finally go forward and get my ticket. One of the many things that held me back was money, or the lack of it but finding the Baofeng radio seemed to have come to my rescue. Other than being much cheaper than any other radio that I have seen out there. Now I can't compare ease of use to another radio since my only other radio I have used prior to this was an Icom radio for my ambulance corps with 2 channels programmed in with no ability to change the programming, or for that matter any need to re-program it. I am glad that I have stumbled on this group to help me not only with my radio, but with being a new ham. I look forward to learning from all of you, and eventually being able to teach both here, and locally when the time is right.

Thank you again for the excellent resource,

Hi again and thank you all for your replies.
To answer to your questions:
battery fully charged.
the screen does nothing only the noise.
it is doing this thing even i am away from house and no other electronic device is next to me.
i adjust the squelsh from 0-9 in every place and is doing the same thing in every adjustment.

I am now looking for a cable to try what Jim KC9HI said....

Subject: [baofeng_uv5r] Baofeng UV-5R problem

Hello to you all.
I am faceing a problem with a brand new unit of Baofeng UV-5R.
The unit starts emitting pulses of static noise a few seconds after being turned on.
It is the same problem as the video below
http://www.youtube.com/watch?v=X0mdrCx8GXs http://www.youtube.com/watch?v=X0mdrCx8GXs

And here is my units video
http://www.youtube.com/watch?v=PfzqP3-1IJE&list=FLPTmQBLJcDw576hDj-Q-C1w&feature=mh_lolz
http://www.youtube.com/watch?v=PfzqP3-1IJE&list=FLPTmQBLJcDw576hDj-Q-C1w&feature=mh_lolz

Can you please give me an advise how to fix it ??

That depends on how elaborate you want it - which is related to how usable it will be and exactly what you want to do with it.

> or maybe i can just connect the two handy like using two
> normal audio jack cable?
>
> 2.5mm(speaker)to3.5mm(mic)directly connect,and on the VOX for
> the ptt transmit?

Yes and no. While what you suggest will certainly work (subject to appropriate adjustment of levels), it is unlikely to work well and the two sets are likely to interact. There will probably be breakthrough which at best will cause the receiver to "de-sense" so it will appear to go deaf and stop working, or worse will cause feedback (howlround) until you turn it off or something fails. Remember also these rigs sre not designed for anything approaching continuous operation - leave one trasmitting for more than a few minutes and it will overheat.

It might be an interesting project to experiment to see just how "simple" a repeater could be made, but the results might not be practical.

> it is still the same. Anyone have any ideas?
>
>
Method 1

1. Download from your radio to CHIRP
2. Go to the Settings > Other Settings menu to get the firmware version
If Firmware Message 1 = "Ver"
Firmware Message 2 = firmware version
Else
Firmware Message 1 = firmware version
3. Visit http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/
Download the "BFBnnn Reset.img" file that matches your firmware version
4. Load the "220/bad" image and "Reset/good" image into CHIRP so that you
have 2 tabs
5. Copy and paste the channels from the "bad" tab to the "good" tab
6. Edit the settings of the "good" tab to suit
7. Add your UHF channels to the "good" tab
8. Save the "good" tab to an image file and use it from now on

Method 2

1. Email the VHF/220 image file to me
2. I will change the byte necessary to let CHIRP detect it as a VHF/UHF
image
3. I will email the VHF/UHF image file back to you

34985. CTCSS using CHIRP

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-09 12:19:46 UTC
From: <epeters242@...>
Topic: 34985 Message: 34985

Whenever I try to program my radio using CHIRP with a transmit CTCSS of 100, it doesn't work. I set the tone mode column to "tone" and set the tone column to 100.0. However, when I check the settings on the radio after I have uploaded it, the transmit CTCSS says it is 88.5 and it also apparently has the same for a receive CTCSS. Isn't setting the tone mode to "tone" only supposed to transmit a CTCSS and have an open receive? Also, when I try to program the radio manually, it works fine. Any help would be appreciated.

I have had some issues with CHIRP changing tone settings on me and had
to go back and fix them several times. Don't know what causes it, but
after a few attempts it settled down.

OK, that’s a defective radio.

You’re going to have to get in touch with the vendor and arrange to exchange it.

Ethan,
After you select the 100.0 tone in CHIRP, you have to click off of the menu in some other cell to make it 'stick'. A good way to check is to click the [Go] button near the top left of the spreadsheet view. If the value switched back to the 88.5 default after pressing the button, then it wasn't set properly.

You can’t check the settings of individual channels on the radio itself. All you ever see is the values that will be programmed into a new channel.

If you download the image again you’ll see what it took and you can ensure it matches what you want.

Are you saying tones other than 100 work?

KC9HI may be right if you aren’t clicking off the tone menu before you upload.

Hello All,

This is my first posting here. I received my technician license last month and bought a UV-5R as my first radio. At the same time, I bought several "rubber ducky" antennas of varying lengths and capabilities as well as a mag mount for my vehicle.

I set the mag mount on the metal roof on my house and had mediocre performance at best. The "rubber ducky" antennas seemed to perform just as well if I stepped outside. I must say that I was totally unenthusiastic about my new HT ... that is, until I spoke to Tim Chapman over at Arrow Antennas.

Tim was very helpful when I asked questions about his J-Pole antennas and ultimately, based upon my needs, directed me to their GP 146/440 ground plane antenna. I got it mounted on my roof yesterday and spent the afternoon and early evening talking to people all around the Nashville, TN area. It works great!

I'm very impressed with Tim, Arrow Antennas, and the performance of my little UV-5R HT and just though I would pass this info along to the group. Here's a link to the antenna that I purchased:

Not correct. In channel mode, menus 10, 11, 12 and 13 are "read only" and
all you can do is check the settings of the individual channels.

> All you ever see is the values that will be programmed into a new channel.
>

This is only true in frequency mode. In channel mode you will see the
programmed value of the channel.

> ****
>

This works, but if you use the [Go] button you won't have to waste time
writing to the radio and reading it back again just to find out it was the
change wasn't set. Using the [Go] button, you will know instantly.

Curiousity

#1 What mag mount did you try?

#2 When you mounted the mag on your roof was it tilting with the roof line? That would tilt the pattern too.

#3 When you mounted the mag on your roof did you put it in the center of the roof? Off center will affect the pattern too.

#4 Having such a huge ground plane for your mag mount probably isn□t a good thing have to model it to be sure.

#5 I would expect much better from a ¼ wave with radials so your experience jives with that idea

#6 I□d expect even better from a ½ wave or 5/8 wave.

#7 You should ensure your new Arrow antenna is at least ¼ wavelength above the roof line i.e. at least ½ meter above the roof.

You can see the potential added power from a ½ wave from my testing (the top 2 antenna results)

http://groups.yahoo.com/neo/groups/baofeng_uv5r/conversations/messages/34861

I use a Diamond X30A and it performs marvelously. Haven□t compared it against any other ½ wave that would be an expensive hobby J

For fun I may make my own and see what I can come up with.

Guy's
Not wanting to hash up an old post. However, I have tried everything and still nothing! I installed the Python Runtime, fine. Installed CHIRP, fine.
Installed the driver. Nothing.... I checked by using this in terminal "kextstat -b nl.bjaelectronics.driver.PL2303" and it doesn't show anything. I used the installer "PL2303_Serial-USB_on_OSX_Lion.pkg" and it doesn't seem to be installing. When I try and use chirp, I do not see the correct port for the pl2303. What am I missing?
Thanks,
Kyp

34995. Any interest?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

I'm thinking about ordering a case of Baofeng UV-5R radios and was wondering if any of you would be interested in taking advantage of the bulk discount.

I can sell them for $39.99 US and cover my costs. If there is enough interest, I'll add them to my website so you can place an order.

Why not order that same radio from one of the vendors that has been
offering great pricing to us for months now?
I recommend checking with Three Old Crows General Store, Kurt has been
nothing but helpful on this group.

Was the metal roof grounded to the antenna lead shield, if not, it probably was not functional as a ground plane ..and I am not sure I would really want to have a roof grounded for the reasons of lightning!

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of Michael Black

Subject: RE: [baofeng_uv5r] Awesome Antenna!

Curiousity

#1 What mag mount did you try?

#2 When you mounted the mag on your roof was it tilting with the roof line? That would tilt the pattern too.

#3 When you mounted the mag on your roof did you put it in the center of the roof? Off center will affect the pattern too.

#4 Having such a huge ground plane for your mag mount probably isn□t a good thing have to model it to be sure.

#5 I would expect much better from a ¼ wave with radials so your experience jives with that idea

#6 I□d expect even better from a ½ wave or 5/8 wave.

#7 You should ensure your new Arrow antenna is at least ¼ wavelength above the roof line i.e. at least ½ meter above the roof.

You can see the potential added power from a ½ wave from my testing (the top 2 antenna results)

http://groups.yahoo.com/neo/groups/baofeng_uv5r/conversations/messages/34861

I use a Diamond X30A and it performs marvelously. Haven□t compared it against any other ½ wave that would be an expensive hobby J

For fun I may make my own and see what I can come up with.

Subject: [baofeng_uv5r] Awesome Antenna!

Hello All,

This is my first posting here. I received my technician license last month and bought a UV-5R as my first radio. At the same time, I bought several "rubber ducky" antennas of varying lengths and capabilities as well as a mag mount for my vehicle.

I set the mag mount on the metal roof on my house and had mediocre performance at best. The "rubber ducky" antennas seemed to perform just as well if I stepped outside. I must say that I was totally unenthusiastic about my new HT ... that is, until I spoke to Tim Chapman over at Arrow Antennas.

Tim was very helpful when I asked questions about his J-Pole antennas and ultimately, based upon my needs, directed me to their GP 146/440 ground plane antenna. I got it mounted on my roof yesterday and spent the afternoon and early evening talking to people all around the Nashville, TN area. It works great!

I'm very impressed with Tim, Arrow Antennas, and the performance of my little UV-5R HT and just though I would pass this info along to the group. Here's a link to the antenna that I purchased:

Just trying to co-op some buying power here. It looks like I could save
everyone $10 per radio over Old Crows.

I saw it as a community service. Sorry if I offended anyone. I haven't
been on this list long and didn't know what to expect.

I think it is a good-intentioned offer but I know my limitations and prefer to buy from a live voice that can answer my questions and give me feedback like Kurt. I may pay a little more, but I was able to get my radio running in less than an hour. Not too bad for a person has no electrical knowledge and passed the test on memorization only. (I was told by the person who talked me into it that it wouldn't matter, boy was he wrong). If you have little or no experience, I would recommend paying the extra for peace of mind. Lori KD0QWE

I generally guarantee non DOA and will replace any defective units within
the first 30 days. After this, the manufacturer would handle warranty.

I would assume that the mag mount would work the same way it would when you attach it to a vehicle (which is not grounded).

35008. Programming UV-5r+ From Keypad issues (Need Assistance)

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-09 16:01:00 UTC
From: kd5ttz@bellsouth.net
Topic: 35008 Message: 35008

Morning all.
I seem to be missing something here.
While programming the radio from the keypad, It works fine if frequency mode. I go to save the frequency in channel-000 and it doesn't work. I have followed these steps.

1- Set desired receiving freq. = 147.330
2- Set Menu 13 to the correct T-CTCSS = 173.8
3- Set Menu 25 SFT-D = +
4- Set Menu 26 OFFSET = 00.600

Back in freq. mode and can talk fine on the repeater.

5- Menu 27 Select CH-000 "Receiving Memory" (wait for it to return to frequency)
6- Using the star key to get the reverse freq.
7- Menu 27 "Transmitting Memory" (wait for it to return to frequency)

Tray again in frequency mode all is good.
Switch to "Channel Mode" go to channel 000 or 001 (I tried both) and not working.

So, am I missing something here?
Thanks,
Kyp

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

This apparently was a special manufacture run of radios that are in fact 2M/1.25M. I tested with two different repeaters last night and it worked pretty good.

They won't work on 220 unless it is made for that band it might show it as being there but it don't work on that band unless u buy the 2m 220 radio

Sent from my iPhone

On Oct 8, 2013, at 1:53 PM, Bob Clabaugh <bobc@catcominc.com<mailto:bobc@catcominc.com>> wrote:

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.
In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Kyp-
Here using CHIRP and UV-5r on MacBookPro OSX 10.8.5 for about a month.
If you didn't properly install the Python runtime then CHIRP would not open, so that part seems OK.
With the USB cable plugged in (don't need the radio just yet), once the "generic" Prolific driver is installed, you should be able to open Terminal app and type in
" ls /dev/cu* " (no quotes). You should see a number of items, like this:

/dev/cu.Bluetooth-Modem /dev/cu.Bluetooth-Serial-2
/dev/cu.Bluetooth-PDA-Sync /dev/cu.PL2303-000012FD
/dev/cu.Bluetooth-Serial-1 /dev/cu.SGH-A927-SerialServer

On my computer, the programming cable driver is the one called /dev/cu.PL2303-000012FD

It's possible you may not have properly installed the driver.
When you download the file, you should have gotten a .dmg (disk image) file.
Double-clicking will mount a virtual Drive icon on your desktop, the contents of which is a .zip compressed file. Double click to extract the .zip file. It contains a folder with the driver installer .pkg file, a README and a PDF install guide, which really tells you everything you need to know to continue. Not at all complicated, just has to be done correctly.
If you did not eventually see and double click the .pkg file, which opens an Installer program, you did not actually install the driver.

Once the driver is installed (good idea to restart the computer at this point), plug in the USB cable. Open CHIRP. With radio off, plug the radio end of the cable into the UV-5r, then turn it on (don't know if this makes
any difference, just how I do it). In CHIRP "Radio" menu, select "Download from Radio." You should see a small window with three dropdown menus "Port", "Vendor", "Radio." Vendor should say "Baofeng" Radio should say "UV-5R" Port should list the same items as above, but select "/dev/cu.PL2303-0000xxFA".
There may be more than one listing like this. The last digits (xx) signify the physical USB ports, so, selecting one may be correct, and allow you to proceed, or you may get an Unable to Communicate message, in which case just select the alternate and it should work. Once the correct driver/port is selected, "DOWNLOAD from Radio" to load CHIRP with an image file of the radio's memory contents. Save that one for backup. You can then edit and create your memory programming for the radio. Do a "Save As" with unique name and can then use that for future editing. Once done, UPLOAD to Radio to rewrite the radio's memory contents with the new info.
Works like a champ once it's set up, and updates/changes just take a few seconds.
Hope this helps. 73

---In baofeng_uv5r@yahoogroups.com, <ksnormand@...> wrote:

Guy's
Not wanting to hash up an old post. However, I have tried everything and still nothing!
I installed the Python Runtime, fine. Installed CHIRP, fine.
Installed the driver. Nothing.... I checked by using this in terminal "kextstat -b
nl.bjaelectronics.driver.PL2303" and it doesn't show anything. I used the installer
"PL2303_Serial-USB_on_OSX_Lion.pkg" and it doesn't seem to be installing. When I try and
use chirp, I do not see the correct port for the pl2303. What am I missing?
Thanks,
Kyp

It would be nice to have an alternative source for the 2M/1.25M Baofeng radio (other than RM in Kentucky, I'll let you google him to see why), but as far as traffic goes, we here in AZ have loads of 2M and 70cm traffic. Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I tend to agree with the group, if you need help (or just want to be secure in the knowledge that help is available), spending a few dollars more with Kurt at TOC is appealing. If all you are looking for is the lowest price, the folks at Amazon already have that price beat for qty. 1 each. I tend to think you get what you pay for.

There are plenty of freight forwarding companies located within the U.S.
(normally around the east and west coasts) that will gladly accept an
incoming shipment from Amazon or e-Bay and then forward the item to you.
Of course, you get to pay for that service.

Except you don't know what antenna you'll get.

Kurt ships with the U-V85 antenna which is notably better than the stock antenna you get on virtually all other (i.e. cheap) UV-5R's.

Mike,

I agree, but find that the vast majority of folks (especially those without a amateur radio license) tend to focus primarily on the cost of the radio as their overriding factor on purchase decisions. These are the folks that will trip over each other to "save" .25 cents on the purchase price between one vendor vs. another, be it on Amazon or e-Bay. Someday one of the folks in China will advertize a UV-5R for .99 cents (with $40 each for shipping) and you'll see the announcement posts of this "sale" price in record numbers.

I use “bongous.com” membership is free.

They will receive the package for you re-package it and ship it to your address by FEDX with tracking.

Shipping is based on weight, box size, import taxes ect.

I have a US address in Bridgeport, CT and one in Brussels, Belgium.

There are plenty of freight forwarding companies located within the U.S. (normally around the east and west coasts) that will gladly accept an incoming shipment from Amazon or e-Bay and then forward the item to you. Of course, you get to pay for that service.

Thanks for the help. Where can I find the driver that you used?
I have
osx-pl2303-0.3.1-10.4-universal.dmg (Didn't work)
When I type ls /dev/cu* in terminal (after the installation and restart) this is what I get.

And as for a screen shot of CHIRP, these are my options.

When selecting the /dev/cu.usbserial This is the error I get. So something didn't install correct.

> Once the driver is installed (good idea to restart the computer at this point), plug in the USB cable. Open CHIRP. With radio off, plug the radio end of the cable into the UV-5r, then turn it on (don't know if this makes
>
> any difference, just how I do it). In CHIRP "Radio" menu, select "Download from Radio." You should see a small window with three dropdown menus "Port", "Vendor", "Radio." Vendor should say "Baofeng" Radio should say "UV-5R" Port should list the same items as above, but select "/dev/cu.PL2303-0000xxFA".
>
> There may be more than one listing like this. The last digits (xx) signify the physical USB ports, so, selecting one may be correct, and allow you to proceed, or you may get an Unable to Communicate message, in which case just select the alternate and it should work. Once the correct driver/port is selected, "DOWNLOAD from Radio" to load CHIRP with an image file of the radio's memory contents. Save that one for backup. You can then edit and create your memory programming for the radio. Do a "Save As" with unique name and can then use that for future editing. Once done, UPLOAD to Radio to rewrite the radio's memory contents with the new info.

To fix it, move to a location that isn’t near another transmitter – especially move to a location far from any paging service transmitter.

Hello to you all.
I am faceing a problem with a brand new unit of Baofeng UV-5R.
The unit starts emitting pulses of static noise a few seconds after being turned on.
It is the same problem as the video below
http://www.youtube.com/watch?v=X0mdrCx8GXs

And here is my units video
http://www.youtube.com/watch?v=PfzqP3-1IJE&list=FLPTmQBLJcDw576hDj-Q-C1w&feature=mh_lolz

Can you please give me an advise how to fix it ??

Actually, Jim, Class D CB in the US has had SSB available a LOT longer than
just 20 years -- but the vast majority of actual Class D CB operation is
still AM. SSB is popular with a tiny fraction of operators - most of whom
spend their time illegally operating between 27.410 and 27.990

I just received my UV-5RA and can't receive any local repeaters. I don't have another radio to test simplex. Bottom line, I haven't heard a word come out of the speaker (except for the voice menu). I've unsquelched and hear static, but not even a faint signal on any frequency. I can't key repeaters (or if I am, I can't hear it). I know these radios are notorious for being difficult to program, but I'm pretty certain I should have heard something. Even NOAA stations won't come in. Is there something I'm doing wrong or this bad out of the box?

It's always about the antenna. You can skimp on the radio and make up the difference with a fancy antenna.

> Actually theses radios aren't difficult to program. The fine manual that
come with the radio doesn't cover programming channels into the radio. In a
lot of cases the owner expects the radio to program one way and lets that
get in the way of learning how it really programs. A lot of guides and
videos that try to show how to do it are missing critical steps that might
be obvious to someone that knows how to program the radio (like someone
making a guide or video) but may not be so obvious to someone that has
never attempted it before. That's why I recommend using any of the guides
on the Miklor website or the WP4AOH blog for first time keypad programmers.

If you live in the USA and you are in the coverage area of one of the NOAA
weather radio transmitters, that is the best way to checkout a new radio to
see if it works. But right now amidst the government shutdown, don't expect
the transmitter to be on 24/7. I tuned to my NOAA station last week and it
was off-the-air. It is back on-the-air because I believe that it is
considered one of the essential services. But when the system goes down,
the personnel required to take care of the NOAA station problems are
probably in short supply.

Have you tried picking up a local broadcast FM station? Surely you have at
least one of them in your area. That might make you feel a little better.

Many ham repeaters nowadays require you to transmit a CTCSS tone to access
them. If you don't have the correct transmit CTCSS tone programmed, you
will never bring up the repeater. Most of these repeaters do not transmit
the tone back. So do program a receive CTCSS tone or you will never hear
anything (even if you are bringing up the repeater). So until you have this
sorted out, do not program any receive CTCSS tones or receive DCS codes.
Only use them when you know your radio is working and you are positive that
the station(s) you are listening to are transmitting them.

Good luck and 73,
Jim KC9HI

Yes, just what we need, more unlicensed hoards on the HF, VHF, and UHF bands, but as long as we're dreaming, why not add D-Star, 220, and 900 MHz with an option for 200 watts (like the Kenwood TS-480HX). Shoot, I'll bet the good old boys would go up to $400 for that rig (chuckle).

So your saying that we all need to pay twice as much for gear because if it was cheaper more people would buy them and find out about ham radio? Every one i sell radios to is informed on the law and how to get licensed along with information about the local ham clubs and testing dates and times

You know that there is less than 5% of the population with a ham licence and most of those people are over 60? We need new blood in the hobby and one way to do that is to get people into it anyway we can.

That is my video. The radio is defective. Try Jim's suggestion before replacing it if you can. I am curious if will actually work.

sad but true. If you don't believe it give a listen to a typical 20meter qso. Most of the discussions are about teeth and hip replacements. (I may be in this category soon myself)

It seems like the rest of world doesn't view hams as old fogeys but that's how it is in USA. There seems to be a path of interest for the youngsters thru the raspberri pi and audino. I'm seeing articles about using raspberri as a wspr transmitter by bit banging the GPIO. I may have to upgrade my sb101. :)

Baofeng will be making a 1.25 M version but not in the UV5R design case, Look for it within a few months.

They are waiting for acceptance approval before they will place it on the market.

Other child companies are doing the same thing with a Tri-band version expected 70 cm, 1.25, 2m. Also they are in the process of some HF mobile units.

Look into some of the recent clones of Yaesu models that just came out with Yaesu looking at IPR lawsuits.

Get them while you can.

It would be nice to have an alternative source for the 2M/1.25M Baofeng radio (other than RM in Kentucky, I'll let you google him to see why), but as far as traffic goes, we here in AZ have loads of 2M and 70cm traffic. Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.

In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Subject: [baofeng_uv5r] BAOFENG UV5R-S

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

OK, thanks for the replies. Very helpful group!

After digging in a little deeper, I found a closer NOAA station and when unsquelched, I was able to hear the signal. It was very weak, but I was encouraged that the unit was capable of receiving SOMETHING...I moved position and found spots where the reception was OK enough to hear the reports clearly. This is from a station putting out 500 watts only 15 miles away! I really suspect that the front end on this radio may be defective. I played around and was able to key a local repeater, but again, the reception was terrible. I can key the repeater with 1 watt, yet the station ID is barely readable. The HT seems very sensitive to my position and the orientation of the antenna. Too much so, imo.

Rather than stress about whether I got a bad one, I just ordered another from Amazon which will be here Friday. I'll compare them both and be certain that I didn't get a defective unit.

Thanks for the help. I'll take advantage of my time with this one to learn the ropes. The programming is definitely quirky, but I kind of like it...

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

Try this before giving up:

1. Set the frequency to the NOAA frequency for your area and turn up the volume. Do you get audio?
2. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?
3. Plug in the headset that came with the radio. Do you get audio?
4. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?

If you get audio at step 1, everything is working

If you get audio at step 2, you may have a receive CTCSS Tone or receive DCS code set (check menus 10 & 11), both should be OFF
If you get audio at step 2 AND menus 10 & 11 are both set to OFF, then you probably have a corrupted memory. See http://www.miklor.com/uv5r/UV5R-Recovery.php
http://www.miklor.com/uv5r/UV5R-Recovery.php

If you get audio at step 3, the problem is either the internal speaker or (more likely) the mic/earphone plug on the radio. Since the radio is new, return it as defective.

If you get audio at step 4, you have both problems 2 & 3 above.

If you still have not gotten any audio, return the radio as defective.

Subject: [baofeng_uv5r] Is my UV-5RA broken?

I just received my UV-5RA and can't receive any local repeaters. I don't have another radio to test simplex. Bottom line, I haven't heard a word come out of the speaker (except for the voice menu). I've unsquelched and hear static, but not even a faint signal on any frequency. I can't key repeaters (or if I am, I can't hear it). I know these radios are notorious for being difficult to program, but I'm pretty certain I should have heard something. Even NOAA stations won't come in. Is there something I'm doing wrong or this bad out of the box?

I think you will find that your percentage of licensees (at least in the US) is off by more than an order of magnitude. It is closer to 0.2%. And general/extra tickets required to operate on HF account for less than half of that last I checked.

I agree that we need to get new blood into the hobby, just not "any way we can". Getting an amateur ticket still should be be earned. Personally, I'd like to reward youth interested in STEM subjects with a license and radio.

I do not believe you are going to see a reasonable new HF/VHF/UHF all-mode radio for that price. There is a reason those radios cost what they do. You would find a radio with the selectivity of the Baofeng HTs pretty useless on HF. And the filters required to keep the signals in the narrow HF bands for TX are pretty expensive. The fact that the Chinese cannot produce a good VHF/UHF FM mobile transceiver for much less than that price is a good indication of the manufacturing costs.

We can all sell product for well under current market price -- it doesn't take a genius to do that. Real genius is designing an all-mode HF/VHF/UHF radio that can be manufactured, shipped, marketed and supported for that price. Even if labor cost per radio approached 0, I don't think it can be done.

However, there are already a bunch of nice HF SDR radios available for the ham just starting out to experiment with that are in the $80-150 range. The bands are going to be limited, and they are going to require a computer to do the modulation and demodulation. But they are a great way for new hams to get involved in the hobby.

Try clearing that memory then putting in your frequency. Sometimes they put in test frequencies at the factory. The Baofeng won't let you overwrite an already written to memory channel.

Where I live there is almost no activity on vhf and uhf. Twenty years ago there was at least one repeater with traffic all day. Most of the time three or four repeaters were active.

Subject: Re: [baofeng_uv5r] Re: BAOFENG UV5R-S

So your saying that we all need to pay twice as much for gear because if it was cheaper more people would buy them and find out about ham radio? Every one i sell radios to is informed on the law and how to get licensed along with information about the local ham clubs and testing dates and times

You know that there is less than 5% of the population with a ham licence and most of those people are over 60? We need new blood in the hobby and one way to do that is to get people into it anyway we can.

On Wed, Oct 9, 2013 at 6:03 PM, Craig Carnahan <craig.n7lb@gmail.com> wrote:

Yes, just what we need, more unlicensed hoards on the HF, VHF, and UHF bands, but as long as we're dreaming, why not add D-Star, 220, and 900 MHz with an option for 200 watts (like the Kenwood TS-480HX). Shoot, I'll bet the good old boys would go up to $400 for that rig (chuckle).

Baofeng will be making a 1.25 M version but not in the UV5R design case, Look for it within a few months.

They are waiting for acceptance approval before they will place it on the market.

Other child companies are doing the same thing with a Tri-band version expected 70 cm, 1.25, 2m. Also they are in the process of some HF mobile units.

Look into some of the recent clones of Yaesu models that just came out with Yaesu looking at IPR lawsuits.

Get them while you can.

It would be nice to have an alternative source for the 2M/1.25M Baofeng radio (other than RM in Kentucky, I'll let you google him to see why), but as far as traffic goes, we here in AZ have loads of 2M and 70cm traffic. Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.

In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

You seem to make the same mistake many others do regarding the current state of amateur radio.

We have more hams now than any time in the past - period. The FCC and several third party sources will show you more than 700,000 currently licensed folks in the U.S. alone. Based on many VE sessions I can tell you than the vast majority coming in for testing are NOT 60 plus years of age either.

In fact, one of the fastest growing segments within the hobby are teenagers and females, primarily because the FCC (and no doubt with some pressure from the manufacturer's) have made getting a Technician Class license virtually nothing more than an open book test - plus they provide not only the exact questions that you'll see in advance, but also the exact wording for the correct answers on a simple 35 question multiple choice test. If you can't get a license now, you're simply not trying.

Don't get me wrong, I'm glad that we have lots of new blood in the hobby, but to make it sound like we "need" even more cheaply made radios (and then tossing in HF to boot) to attract new blood is simply incorrect, as is the statement about "most" hams being over 60. That may well have been true 20 to 30 plus years ago (when tube radios were still the norm), but it hasn't been that way for many years now.

If the FCC's previous reductions in licensing requirements and the ridiculously low cost of current Chinese VHF/UHF radios aren't enough to wet one's appetite to try amateur radio already, we simply don't need them IMHO. It's one thing to screw up local communications with a 5w VHF/UHF radio, but it's another thing entirely different to give them an HF radio when they simply don't know what they're doing and their signals can be heard worldwide.

You and I both know the first thing most unlicensed folks would want to know in buying a $300 HF rig at a gun show is how to modify it for CB or use it between 10 and 11 meters in what some folks refer to as "free-banding".

Thinking they'll buy the $300 HF rig first and then get their license later is like saying let's allow another 5 to 10 million more folks to pore over the borders and we'll worry about finding them later for the proper documentation - that rarely happens, and certainly not at levels high enough to justify whatever good might occasionally come from it.

35053. Transmit problem after programming?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-10 07:49:39 UTC
From: Jeff Newton
Topic: 35053 Message: 35053

I had a friend program my Baofeng UV-5R, the problem is I can access my local repeaters in the Frequency mode, but, can't get the radio to transmit when it's on Channel mode? I know he programmed it the same way as he programmed his own Baofeng, his was the shorter version, mine was the upgrade version with extended battery.

So, what could be the problem? As mine recieves fine on freq mode, but in channel mode it just won't key up the repeater and nothing transmit - I was hoping there wasn't any problems with the programming, but now there is for some reason and looks like I'm out of a radio for an event this weekend - but would be nice to use it too during an ARES event.

Any ideas or sugggesion?

If it transmits fine in Frequency Mode, you could always use it that way for now.

How many memories did he program? Is it not transmitting at all in Channel Mode, or only on some memories? Have you verified that the radio is actually dropping 600 (or jumping up) KHz on transmit? Are the PL tones correctly set on the Channel Mode frequencies?

Most of the time if the radio works in Frequency Mode, but appears to not work in Channel Mode it's usually a programming error during your setup.

Craig,

There were 75 memory channels programmed, however the "A" was programmed for Alpha tags and the "B" with the Frequencies, while in channel mode, however the "B" was mixed with both VHF and UHF freqs, while Alpha tags were used in "A" - I did try a repeater on with the CTCSS Tones in both the TX/RX and the repeater did kick back while in Freq mode, but Channel Mode - a different story?

The KHz for each was set for .600 for 2m and .500 for 440 freqs, So, I'm curious tho if it was programming error during set up?

Sure old people on the way out and now many young on the way in. The no code is a big help. Maybe the loser is more code. I'm only 26, for the 31st time, and in the process learning Morse code. I just need to find a good Koch method program "Without" the Farnsworth spacing.

Anyone know of a good program to learn Morse code with normal spacing? I found a couple I like but I'm thinking there are better ones out there.

I ride my bicycle back and forth to work to keep young and avoid replacing anything. :-) Now I need to do more exercise to counteract the evil effects of the fantastic food my wife forces on me. She is an actual chef. A very very good chef. I don't want to look like the stereotypical ham operator. ;-)

Maybe I should put a Mobil unit on my 10 speed. LOL

Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

Strange opinion to have . Im the youngest person in my ham club and im 40 years old... Every ham club i have visited, i was one of the youngest people there. Where are all of these kids and teenagers that you speek of? i never see them at ham fests or ham club events or meetings. the ve's i have talked to say they see lots of boyscout's taking the tests to get a merit badge or electronics people geitng them for a resume but none of them practice the hobby after. Most common reasons given is "! cant aford the equipment" and "every one is elderly i dont fit in", and last but not least, "I have cell phones, wireless internet, and FMRS" If you think they are on cb got news for you they are not on cb. Here in Louisiana the cb bands are almost empty. the trucking company’s have all swapped over to sat based com systems. The cb radios now cost as much as the ham radios. Kids use cellphones now to chat with each other.

Your arguments make so sense based on whats going on in the real world.

If it transmits fine in Frequency Mode, you could always use it that way for now.

How many memories did he program?? Is it not transmitting at all in Channel Mode, or only on some memories?? Have you verified that the radio is actually dropping 600 (or jumping up) KHz on transmit?? Are the PL tones correctly set on the Channel Mode frequencies?

Most of the time if the radio works in Frequency Mode, but appears to not work in Channel Mode it's usually a programming error during your setup.

Craig - N7LB

On Thu, Oct 10, 2013 at 12:49 AM, Jeff Newton <saanpregion@...> wrote:

?

I had a friend program my Baofeng UV-5R, the problem is I can access my local repeaters in the Frequency mode, but, can't get the radio to transmit when it's on Channel mode? I know he programmed it the same way as he programmed his own Baofeng, his was the shorter version, mine was the upgrade version with extended battery.

So, what could be the problem? As mine recieves fine on freq mode, but in channel mode it just won't key up the repeater and nothing transmit - I was hoping there wasn't any problems with the programming, but now there is for some reason and looks like I'm out of a radio for an event this weekend - but would be nice to use it too during an ARES event.

Any ideas or sugggesion?

My twice and I stopped by the local club before taking our exams to say hi and see the lay of the land. All we saw were stereotypical fat bellied, hair unkempt old men. When we took the exam we saw younger people all under 40. There were also three kids ages 8, 10 and 12 years old. The two younger ones passed. I gave the 12 yr old some pointers for next time and I'm sure he will pass. The old farts are at the boring club meetings. The younger ones are out there. Just because you don't see them doesn't mean they are not around. Not everyone likes the same thing and will pursue the hobby in their own way.

Sent from my Verizon Wireless 4G LTE DROID

How did you friend program your radio? Keypad? Baofeng software? CHIRP software?

If he used software, could you provide the Baofeng .dat file or CHIRP .img file for us to look at?

In MR/Channel Mode, you have either one of the display's (top line [A] or bottom line [B]) Memory Display Format set to readout in frequency? If not, use menu 21 (MDF-A) or menu 22 (MDF-B) to set one of them to FREQ.

Now in MR mode, switch to the display that has its MDF set to FREQuency and tune to one of the repeater channels that you know you can access from VFO/Frequency Mode mode.

You should see the receive (RX) frequency for the repeater in the display. You should not see a "DCS" or a "CT" indicated in the left status display. If you do then a receive DCS code (DC) or receive CTCSS tone (CT) has been programmed. Most amateur repeaters do not transmit codes or tones so you would never hear anything and this would be the problem. If there is no indication, then continue.

You should also see "+-" in the upper status display that indicats that the transmit (TX) frequency is different that the RX frequency. If there is no "+-" indication, then the channel is programmed as a simplex channel and this is the problem. If the "+-" is indicated, then continue.

Tap the [*SCAN] key to put the radio in "Reverse Mode" (On older radios, menu 7 (TDR) must be set to OFF for "reverse mode" will work). The letter "R" will be indicated in the upper status display and the TX frequency for the repeater will now be displayed. If tapping the [*SCAN] key to access mode causes the radio to emit a short "bleep" sound, then TX is inhibited and that would be your problem. If no "bleep" sound is heard, then continue.

With the radio in "reverse mode", if the TX frequency displayed is the same as the RX frequency, this is the problem (and it should have been caught a few steps above). Check to see if the displayed TX frequency is correct for the repeater. For most VHF repeaters in the USA the difference would be + or - 0.600 MHz (depending on the direction of offset). For most UHF repeaters the difference would be + or - 5.000 MHz. If it isn't, then this is the problem. If the TX frequency is correct, then continue.

While still in reverse mode, look at the left status display to see if there is a DCS or CT being indicated. Many repeaters now require a transmit CTCSS tone (or transmit DCS code) for access. This cuts down on interference for users of adjacent repeaters on the same frequency. If there is no CT (or DCS) being indicated when CTCSS (or DCS) is a requirement of the repeater, then this is the problem. If you have a CT (or DCS) indication, then continue.

The CTCSS tone (or DCS code) could be incorrect. Access menu 13 (T-CTCSS) (or menu 12 (T-DCS)) to see what tone (code) has been programmed. If it is the wrong tone (code), then this is the problem. If the tone (code) is correct, then continue.

Tap the [*SCAN] key to exit "reverse mode".

If you've gotten this far, you should be able to access the repeater without any issues. If not, check again, there is a lot to check and you may have unintentionally skipped something. If you are sure that all was fine, then I would try the "Erratic Behavior and Recovery" procedure on the Miklor.com website.

Good luck and 73,
Jim KC9HI

Thanks Jim, I'll pass this on, we actually programmed it by using CHIRP, so maybe some thing may have been been in error somewhere?

I am actually thinking of wiping out the programming he did and see if I can hack it manually from your reply and see if this is the case? If so, than could redo the programming by hand myself, since I do not have the programming cable or CHIRP here.

The likeliest error is forgetting to store the offset transmit frequency.

Turn the radio on. Get in channel mode. Select the channel. Punch VFO/MR to get to frequency mode. Punch the * key to select Reverse. Verify the frequency changes to the desired transmit frequency. Punch the * key again, to go back to the receive frequency. Punch VFO/MR to get back to Channel mode.

The second likeliest error is that you forgot to set the transmit CTCSS tone. Pretty much all repeaters these days require CTCSS tones.

Subject: [baofeng_uv5r] Transmit problem after programming?

I had a friend program my Baofeng UV-5R, the problem is I can access my local repeaters in the Frequency mode, but, can't get the radio to transmit when it's on Channel mode? I know he programmed it the same way as he programmed his own Baofeng, his was the shorter version, mine was the upgrade version with extended battery.

So, what could be the problem? As mine recieves fine on freq mode, but in channel mode it just won't key up the repeater and nothing transmit - I was hoping there wasn't any problems with the programming, but now there is for some reason and looks like I'm out of a radio for an event this weekend - but would be nice to use it too during an ARES event.

Any ideas or sugggesion?

Hello

One of my friends that is not no the Internet was asking me if you can get any programs that do morse or RTTY or even SSTV.
As I do not know this answer, I told him that I would ask on this group.
He has the program cable for the radio, and was thinking if this would also be able to hook up a PC and use the cable and the radio to work any of the programs he is interested in.
So first I need to know if the program cable will let him do this.
Second thing is WHAT program's would anyone recommend.
I hope that I get some help with this, even if it is just to get my friend off my back

Bye from John in the UK

CW seemed to be the "filter" for many years. It was a block to new hams coming into the hobby. And why? There are many other modes than just SSB and CW. What makes CW any more important?

And the notion of home brewing a radio from an old bedspring, rolling a capacitor from aluminum foil and wax paper from the kitchen, and an old bread pan for a chassis, and saving the town from the broken damn via CW, well, it's the stuff of Boy's Life magazine, but in the real world it's not going to happen. Sorry.

Aside - I personally think soldering a PL-259 onto some RG-8X would be a good addition to the test.

In what way does eliminating the code requirement harm ham radio? I cannot tell you the number of hams that have told me, "In my heyday I could do 35 wpm, but it's been so long since I used CW I doubt I could break 15 wpm." And from all my listening, I have yet to hear "Breaker, breaker, this is the Duck" on 20 meters.

BTW, a buddy put me up to this... at my very first ham club meeting, which was also the club's Christmas dinner at a local greasy spoon, it was time to write checks for dues for the upcoming year. I was a new ham, the ink hardly dry on the CSCE.

As I was putting pen to paper I looked up and asked, "Is 'the Bandit' taken? I've always wanted that for a handle."

Two guys choked and one spewed iced tea.

It was glorious!

You seem to make the same mistake many others do regarding the current state of amateur radio.

We have more hams now than any time in the past - period. The FCC and several third party sources will show you more than 700,000 currently licensed folks in the U.S. alone. Based on many VE sessions I can tell you than the vast majority coming in for testing are NOT 60 plus years of age either.

In fact, one of the fastest growing segments within the hobby are teenagers and females, primarily because the FCC (and no doubt with some pressure from the manufacturer's) have made getting a Technician Class license virtually nothing more than an open book test - plus they provide not only the exact questions that you'll see in advance, but also the exact wording for the correct answers on a simple 35 question multiple choice test. If you can't get a license now, you're simply not trying.

Don't get me wrong, I'm glad that we have lots of new blood in the hobby, but to make it sound like we "need" even more cheaply made radios (and then tossing in HF to boot) to attract new blood is simply incorrect, as is the statement about "most" hams being over 60. That may well have been true 20 to 30 plus years ago (when tube radios were still the norm), but it hasn't been that way for many years now.

If the FCC's previous reductions in licensing requirements and the ridiculously low cost of current Chinese VHF/UHF radios aren't enough to wet one's appetite to try amateur radio already, we simply don't need them IMHO. It's one thing to screw up local communications with a 5w VHF/UHF radio, but it's another thing entirely different to give them an HF radio when they simply don't know what they're doing and their signals can be heard worldwide.

You and I both know the first thing most unlicensed folks would want to know in buying a $300 HF rig at a gun show is how to modify it for CB or use it between 10 and 11 meters in what some folks refer to as "free-banding".

Thinking they'll buy the $300 HF rig first and then get their license later is like saying let's allow another 5 to 10 million more folks to pore over the borders and we'll worry about finding them later for the proper documentation - that rarely happens, and certainly not at levels high enough to justify whatever good might occasionally come from it.

You know that there is less than 5% of the population with a ham licence and most of those people are over 60? We need new blood in the hobby and one way to do that is to get people into it anyway we can.

Baofeng will be making a 1.25 M version but not in the UV5R design case, Look for it within a few months.

They are waiting for acceptance approval before they will place it on the market.

Other child companies are doing the same thing with a Tri-band version expected 70 cm, 1.25, 2m. Also they are in the process of some HF mobile units.

Look into some of the recent clones of Yaesu models that just came out with Yaesu looking at IPR lawsuits.

Get them while you can.

It would be nice to have an alternative source for the 2M/1.25M Baofeng radio (other than RM in Kentucky, I'll let you google him to see why), but as far as traffic goes, we here in AZ have loads of 2M and 70cm traffic. Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.

In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Subject: [baofeng_uv5r] BAOFENG UV5R-S

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I've read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

Has anyone tried to power their UV-5R with solar yet? What did you use.
What were your results?

Thanks,

You may want to check this out. I saw it on QRZ.Com.

http://www.ebay.com/itm/EASY-DIGI-UV-5R-INTERFACE-for-IPhone-IPad-IPod-Touch-/321221531105?pt=LH_DefaultDomain_0&hash=item4aca4b95e1 http://www.ebay.com/itm/EASY-DIGI-UV-5R-INTERFACE-for-IPhone-IPad-IPod-Touch-/321221531105?pt=LH_DefaultDomain_0&hash=item4aca4b95e1

All the reviews are 100% positive. Evidently the guy that builds these goes way over and above on customer service. I think I'll buy one for my radio.

Hello

One of my friends that is not no the Internet was asking me if you can get any programs that do morse or RTTY or even SSTV.
As I do not know this answer, I told him that I would ask on this group.
He has the program cable for the radio, and was thinking if this would also be able to hook up a PC and use the cable and the radio to work any of the programs he is interested in.
So first I need to know if the program cable will let him do this.
Second thing is WHAT program's would anyone recommend.
I hope that I get some help with this, even if it is just to get my friend off my back

Bye from John in the UK

>My twice and I stopped by the local club before taking our exams to say hi and see the lay of the land. All we saw were stereotypical fat bellied, hair unkempt old men. When we took the exam we saw younger people all under 40. There were also three kids ages 8, 10 and 12 years old. The two younger ones passed. I gave the 12 yr old some pointers for next time and I'm sure he will pass. The old farts are at the boring club meetings. The younger ones are out there. Just because you don't see them doesn't mean they are not around. Not everyone likes the same thing and will pursue the hobby in their own way.

35074. add/delete on scan list

hello group.

I have a early uv5r and know that you can only change your scan list is by software. Does any of the newer models have capability to make changes to scan list by the radio?

The military wanted a pool of people that were proficient in Morse code to draw from in case of a conflict. Now they no longer have that need and poof its dropped.

>And the notion of home brewing a radio from an old bedspring, rolling a capacitor from aluminum foil and wax paper from the kitchen, and an old bread pan for a chassis, and saving the town from the broken damn via CW, well, it's the stuff of Boy's Life magazine, but in the real world it's not going to happen. Sorry.
>
>
>Aside - I personally think soldering a PL-259 onto some RG-8X would be a good addition to the test.
>
>
>In what way does eliminating the code requirement harm ham radio? I cannot tell you the number of hams that have told me, "In my heyday I could do 35 wpm, but it's been so long since I used CW I doubt I could break 15 wpm." And from all my listening, I have yet to hear "Breaker, breaker, this is the Duck" on 20 meters.
>
>
>BTW, a buddy put me up to this... at my very first ham club meeting, which was also the club's Christmas dinner at a local greasy spoon, it was time to write checks for dues for the upcoming year. I was a new ham, the ink hardly dry on the CSCE.

>You seem to make the same mistake many others do regarding the current state of amateur radio.
>
>We have more hams now than any time in the past - period. The FCC and several third party sources will show you more than 700,000 currently licensed folks in the U.S. alone. Based on many VE sessions I can tell you than the vast majority coming in for testing are NOT 60 plus years of age either.
>
>In fact, one of the fastest growing segments within the hobby are teenagers and females, primarily because the FCC (and no doubt with some pressure from the manufacturer's) have made getting a Technician Class license virtually nothing more than an open book test - plus they provide not only the exact questions that you'll see in advance, but also the exact wording for the correct answers on a simple 35 question multiple choice test. If you can't get a license now, you're simply not trying.
>
>Don't get me wrong, I'm glad that we have lots of new blood in the hobby, but to make it sound like we "need" even more cheaply made radios (and then tossing in HF to boot) to attract new blood is simply incorrect, as is the statement about "most" hams being over 60. That may well have been true 20 to 30 plus years ago (when tube radios were still the norm), but it hasn't been that way for many years now.
>
>If the FCC's previous reductions in licensing requirements and the ridiculously low cost of current Chinese VHF/UHF radios aren't enough to wet one's appetite to try amateur radio already, we simply don't need them IMHO. It's one thing to screw up local communications with a 5w VHF/UHF radio, but it's another thing entirely different to give them an HF radio when they simply don't know what they're doing and their signals can be heard worldwide.
>
>You and I both know the first thing most unlicensed folks would want to know in buying a $300 HF rig at a gun show is how to modify it for CB or use it between 10 and 11 meters in what some folks refer to as "free-banding".
>
>Thinking they'll buy the $300 HF rig first and then get their license later is like saying let's allow another 5 to 10 million more folks to pore over the borders and we'll worry about finding them later for the proper documentation - that rarely happens, and certainly not at levels high enough to justify whatever good might occasionally come from it.

Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I want to learn straight. I don't want to go from wide spacing to narrow. Just dive in the deep end and stay til I swim. Some like Farnsworth some don't. I'm on the side of don't. :-)

Make sure duplex is set. If it is set to none, you cant transmit on that freq. The HT will just beep when you press ptt.

This is if you are using chirp to program. If you are doing it manually, you cant set the duplex.

---In baofeng_uv5r@yahoogroups.com, <strohm@...> wrote:

The likeliest error is forgetting to store the offset transmit frequency.

Turn the radio on. Get in channel mode. Select the channel. Punch VFO/MR to get to frequency mode. Punch the * key to select Reverse. Verify the frequency changes to the desired transmit frequency. Punch the * key again, to go back to the receive frequency. Punch VFO/MR to get back to Channel mode.

The second likeliest error is that you forgot to set the transmit CTCSS tone. Pretty much all repeaters these days require CTCSS tones.

Subject: [baofeng_uv5r] Transmit problem after programming?

I had a friend program my Baofeng UV-5R, the problem is I can access my local repeaters in the Frequency mode, but, can't get the radio to transmit when it's on Channel mode? I know he programmed it the same way as he programmed his own Baofeng, his was the shorter version, mine was the upgrade version with extended battery.
So, what could be the problem? As mine recieves fine on freq mode, but in channel mode it just won't key up the repeater and nothing transmit - I was hoping there wasn't any problems with the programming, but now there is for some reason and looks like I'm out of a radio for an event this weekend - but would be nice to use it too during an ARES event.

Any ideas or sugggesion?

When the radio beeps when you press ptt and does not transmit, it is because 'duplex' is set to 'none' when you program the channel with chirp.

Just make sure duplex is not set to 'none'..

You can set duplex to none on ems and noah channels and it will prevent you from transmitting on them accidentally.

Bill,
Did these radios work at all when they were new?
Did anyone try to Open Up the radios to work outside the specified range? Or alter it in any way with software?
If so, there is a fix, but need to verify the initial cause.

Won't transmit at all or won't transmit any audio? I have one here, brand new, that t ransmits a carrier but no audio. The problem lies in the external mic socket, where the spring contacts are not closing properly, leaving the internal mic disconnected. Plug in an external mic and all is well. It's awaiting me to find the time to perform the required surgery to fix or more likely replace the jack..

Hi Evans:

That looks pretty neat! It would be a convenient answer for those who
would want to use digital modes on the UV-5R.

One caution: most digital modes are an extended transmission mode..
meaning, that you are transmitting for more than 30 seconds or so.
The UV-5R can heat up when you have extended transmissions,
particularly when running full power, and using a rubber duck antenna.

If you run the HT at low power, and use an external amp for more power
(if you need it), you'd be treating the HT more gently.

Also, consider that most digital modes were designed for use on HF
with SSB transmitters, and that's where modes like PSK31 and RTTY
shine. SSTV could be a useful tool, particularly for ARES and similar
emergency communication: the ability to send a photo of a situation
could be quite valuable (a picture being worth 1000 words, etc.) But
again, many SSTV standards require several minutes of continuous
transmission, especially for high-res color. The old Robot B&W system
could send a frame in 8 seconds... but it was low-res.. 128 by 128
pixels... OK for text or a face shot, but not much else.

Like you, however, I think I'll get one of those gadgets. I like to
support hams who make aftermarket add-on gadgets like that. :)

I don’t know – my 14 year old son has his license and I’m not exactly ready for new teeth myself. One of the local NTS nets I participate in has a control operator that works on a UV-5RA with a homemade dipole from his tree fort.

There is a growing circle of under 50-somethings in the Pacific Northwest. Of course, there are also quite a few “experienced” operators as well!

Subject: RE: Re: [baofeng_uv5r] Re: BAOFENG UV5R-S

sad but true. If you don't believe it give a listen to a typical 20meter qso. Most of the discussions are about teeth and hip replacements. (I may be in this category soon myself)

It seems like the rest of world doesn't view hams as old fogeys but that's how it is in USA. There seems to be a path of interest for the youngsters thru the raspberri pi and audino. I'm seeing articles about using raspberri as a wspr transmitter by bit banging the GPIO. I may have to upgrade my sb101. :)

So your saying that we all need to pay twice as much for gear because if it was cheaper more people would buy them and find out about ham radio? Every one i sell radios to is informed on the law and how to get licensed along with information about the local ham clubs and testing dates and times
You know that there is less than 5% of the population with a ham licence and most of those people are over 60? We need new blood in the hobby and one way to do that is to get people into it anyway we can.

It would be nice to have an alternative source for the 2M/1.25M Baofeng radio (other than RM in Kentucky, I'll let you google him to see why), but as far as traffic goes, we here in AZ have loads of 2M and 70cm traffic. Last I checked we even have around 25 repeaters up on 220 (and a similar number up on 900MHz, which really surprised me).

I’m looking at doing something specific and the lack of traffic on the 220 band is exactly what I am looking for.

I’m planning at using the repeater to connect via IRLP or other Internet based connection to another node in the Los Angeles area. This is to provide a link between my area in Oregon and the LA area. Have lots of Ham friends and family in the South Bay area.

There is actually quite a bit of 2M/70CM in this part of the North West if you know where to look.

And, BTW, the UV-5RS radio does work on 220!

Thanks for the response.

Bob,

Not too sure about 220? I don't really know of anyone using this band anymore. I guess it depends on the location.

In fact, there aren't many hams using 2 meters or 70cm anymore. Most of the activity seems limited to the work commute.

Subject: [baofeng_uv5r] BAOFENG UV5R-S

Greetings,

Picked up a nice 220 repeater last weekend that I intend to use mainly for communications with family back in Los Angeles (I’m in the Portland, Oregon metro area) via IRLP or private VOIP Asterisk.

To help work it, I purchased a UV-5RS radio off Ebay which is supposed to be a specially manufactured 220/146 version of the same radio I already have (UV-5RA).

I haven’t got the repeater fully working yet so I can’t test out the 1.25M features of the radio. There aren’t many 1.25M repeaters in this area (which is the idea). The 2M part works great. I was able to program through Chirp and it does report the channels as expected.

Without an SWR meter it’s a bit tough to tell what this thing transmits on the 220 band.

Anyone heard of this guy (he is selling a lot of them) and know if I need to be worried? I’ve read a lot about the band pass filters and such but this was a new radio in factory packaging.

Anybody got experience with this radio? Anything would be welcome.

Thanks,

Bob Clabaugh

I'm tempted to be cruel and agree with you, but, suffice it to say; no, 147.000 is not the same as 145.000?

To be slightly more helpful;

1. Check that no receive CTCSS is set (via software)
2. Ensure that there actually is activity on the frequency you have set - maybe there isn't any activity!
- have you tried another frequency?

Cheers

Duncan

Not sure of the amateur radio licensing requirements "down under" Richard, but if you want to have some fun (just listening of course since you don't have a license to talk), set your radio to 147.00 and monitor Brisbane's 2m IRLP node.

You may be surprised to learn that your radio (with the proper amateur radio license) can access a repeater (and with that repeater being linked into the internet), you can work the world with your handheld radio.

If nothing else, you'll certainly hear folks from all over Australia which would normally be well outside the normal "range" of a small HT.

This is my method of programming:

Repeater Programming:
1. VFO-A - enter Rx freq
2. Menu 1 - step size 2.5/5/10 etc
3. Menu 13 - CTCSS freq
4. Menu 25 - shift + / -
5. Menu 26 - freq offset
6. Menu 27 - save Rx freq to a memory.
7. Exit
8. VFO-A - set Tx freq
9. Menu 27 - save Tx freq to same memory.
10. Exit.

Works for me.

Cheers

Duncan - M0RGO

Hi
this is my first new topic here on this group.
I am programming the radio thru the keyboard. But I am not sure if the CTCSS tones are being saved.
My impression is that I should set the tone and power levels etc first.
Then set the frequencies of receive and transmit.
The channel will have everything set now.
Is this the way it works?
thanks 73
Joe W3TTT

Joe,

Yes. Set all of the various settings first. Key in the RX frequency and store it into an empty channel. If it isn't a simplex channel, then key in the TX frequency and write it to the same channel. Once you have created a channel, the only parameters that you can update are the T-DCS code, T-CTCSs tone and TX frequency. Anything else requires the channel to be erased and programmed again.

35096. H-T Antennas Made Simple

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-10 18:55:29 UTC
From: <k4ize-bw@...>

Mike’s excellent post the other day contained a lot of good info on antennas that are available commercially. However, you have to have an understanding of what “dB” is and how it works when discussing antennas. Mike's scale is unusual in that it referenced an S-meter reading that is commonly based on micro-volts of received signal. It is not an “antenna” standard.

A change in power by a factor of 10 is a 10 dB change in level. A change in power by a factor of two is approximately a 3 dB change.

dBi (isotropic) is the forward gain of an antenna compared with the hypothetical isotropic antenna, which uniformly distributes energy in all directions.

Imagine for a moment an antenna in space, of no length at all, magically radiating 5W. Its pattern is a perfect sphere, and there is nothing affecting the signal. That is zero dBi. The effective radiating power (ERP) is 5W. Now let’s attach an antenna that is rated at 3dBi. The ERP is doubled as though the “transmitter” is now running 10W. It’s that simple.

Although there are many commercial antennas available for the Baofeng H-T, there is almost no factual, technical info available about such things as the output impedance (Z) of the radio, or about the feed point of the antenna. It is difficult to make an antenna with a natural Z of 50-Ohms at the end feed point that would be small and practical enough for H-T use on both the 2M and 70cm bands. Any such method would also introduce loss. Quarter-wave antennas are resonant, simple and easy; but, are very high-Z when end-fed.

The following examples are of easily made, inexpensive antennas that provide good gain. Only one is practical for a radio-mounted antenna meant to be easily maneuvered. Values are expressed as (2M / 70cm).

(1) Pseudo-Half-wave Dipole: Gain= 3.8 / 8.6 dBi, SWR= 1.1 on both bands, low takeoff angles.

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). A second moderately flexible 19-in wire (14# stranded) is soldered to the ground side of the same connector, and allowed to trail down where it will. ERP is about 10W on 2M and close to about 15-20W on 70cm.

Antenna-2 is intended to be a portable, collapsible antenna for packing along and set up on a desktop, etc. Performance is similar to Antenna-1 with slightly less gain on 70cm.

Antenna-3 is a fixed, double half-wave antenna on both bands. It has adjustable tuning, is made from 1/2-in self-supporting copper pipe, and is ideal for mounting on a mast on the roof. I know of no better dual band, single element, self-supporting, vertical antenna for gain vs. cost. 5W becomes 50W. I use one on 2M/70cm and another on 6M.

Documentation is available for all the above.

No. This would require an additional menu that would allow you to skip or scan a memory when a channel is programmed. There have been no additions to the number of UV-5R menus since it was been introduced in early 2012/late 2011.

Solar panels deliver a range of voltages over the course of a day. Solar-charge-controllers are used to limit the voltage to that appropriate to charge a 12 volt lead acid battery--around 14 volts.

I'd use a small panel and a cheap solar charge controller to charge a 12 volt lead acid battery and then recharge the UV-5R from the 12 volt battery with the solar panel disconnected. (At least some automotive adapters for the UV-5R shut off if the charging voltage is more than approximately 12 volts.)

Amazon has a good selection of solar panels and charge controllers. A 5 watt panel like the following would probably be sufficient. (It depends on how much you use the UV-5R and how much sunlight at your location, etc.)

<http://www.amazon.com/Instapark®-Black-Mono-crystalline-Charge-Controller/dp/B004FOEUI0/ref=cm_cr_pr_pb_t>

Not sure of the amateur radio licensing requirements "down under" Richard, but if you want to have some fun (just listening of course since you don't have a license to talk), set your radio to 147.00 and monitor Brisbane's 2m IRLP node.

You may be surprised to learn that your radio (with the proper amateur radio license) can access a repeater (and with that repeater being linked into the internet), you can work the world with your handheld radio.

If nothing else, you'll certainly hear folks from all over Australia which would normally be well outside the normal "range" of a small HT.

> tags were used in "A"

There are no A or B memories. A & B refer ONLY to the DISPLAY. All memories are available in both displays.

I have yet to figure out why anyone wants to see both an alpha tag AND the frequency for the same memory channel at the same time - especially since doing this is very awkward to accomplish because it requires constantly switching back and forth between the two displays to move them both to the same channel number because there is no way to automatically have both displays show the same channel at the same time.

> - I did try a repeater on with the CTCSS Tones in
> both the TX/RX and the repeater did kick back while
> in Freq mode, but Channel Mode - a different story?

Let me try to say this without getting flamed for being sarcastic or insulting, but this is yet another demonstration that you have no idea how to program the radio or how to use it. Rather than getting someone to program your radio for you, perhaps you should try to have someone show you how to work a radio.

There is NEVER any need for a Rx CTCSS tone - and very rarely any reason to use any Rx tone.

Given that you do not understand the settings, there is almost no chance that you are using the same settings in Frequency Mode and in Memory Channel Mode -- which would account for why the radio does not perform the same way in both modes even when you think your are on the same frequency.

> The KHz for each was set for .600 for 2m and .500 for 440 freqs, So, I'm
> curious tho if it was programming error during set up?

It is certainly a programming error. The offset for 2m is apparently correct (0.6000) but wrong for UHF (it should be 5.0000 not 0.5000).

From the rest of your description it seems likely that there are several other programming errors

Jim, I will have Ben email you the CHIRP image he used. I also did a clean swipe of everything that was programmed in the radio and tried programming it by hand, problem is, I had no problem getting them set up in the freq mode, but when I get to the channel mode it just doesn't want to save what I had in freq mode to channel mode - without having to do the process over again for the tx/tx to make the repeater work in channel mode.

Because some Hams refer to the local repeaters by the call sign, others refer to it by the output frequency and still others by the location. All are correct, but my brain does not have the list cross-referenced to that extent.

Ok, I can see why a new ham (or one new to an area) might sometimes need to refer to an alpha tag and other times might need to refer to a frequency to find an unfamiliar repeater to QSY (although I have rarely found a case where it wouldn't be quicker to simply ask for the frequency from the ham who told you to switch to the WZ9XYZ repeater); but no one planning to do the Alpha in A and Freq in B technique has ever suggested that they would be trying to scroll through the 128 memories (or even a few dozen they have programmed) looking for a particular tag or freq. Invariably they seem to feel some need to know both the tag (which they created) AND the frequency at the same time.

My contrary experience is that it is far easier to simply pick good alpha tags in the first place (some times the best alpha tag IS the frequency) BUT that if you suddenly want to know the frequency of the memory you are on, it is just as easy to use menu 21 (or 22) to simply change what is displayed rather than switching to the other display (which means you are no longer monitoring the channel you are interested in!), then keying in the three digit channel number to bring the second display to the same channel.

This is especially true due to the way the two INDEPENDENT displays work.

If you are in dual receive mode, and are listening to the channel on the A display, then it is nearly impossible to change the B display to that channel number.

If you are not in dual receive mode, then as soon as you switch from A to B, you are no longer listening to the channel that is on the A display and you miss whatever is being said until you get the B display set to the proper channel.

The idea of having Alpha tags shown on A and Frequencies shown on B sounds good, but it only works when you set both displays to the same channel BEFORE you hear anything.

There is nothing wrong with this except it doesn't tell the new user that the target channel has to be empty. This important detail is left out on a lot of manual programming guides and it causes a lot of frustration because the new user tries to reprogram one of the 20 or so factory programmed channels and it does not work even though the instructions are followed to the letter.

Also step 4 and 5 are not required when programming this way. They can just as easily have been set to OFF and the channel will still be programmed correctly. But doing these steps can be useful if you want to test the other settings on a repeater from the VFO before storing the settings to a channel.

Nice work on the comparisons and rather surprising at that! I myself tried several antennas and found the best to be a Diamond dual band with adapter. It also worked best on VHF and somewhat less on UHF but over all far better than the stock antenna.

> frequency for the same memory channel at the same time - ...

Not sure why you suggest "at the same time" ... I have "A" in alpha and "B" in freq. so that I have a simple reminder of what the freq. alpha "name" is whenever I need it. Using the up and down arrows in "A" lets me see the "name" associated with a numeric channel that's displayed in "B". With 128 channels programmed, most of which are used only occasionally, it's a helpful feature, even though one never has the same channel number in both "A" and "B" FYI.

35120. Re: [baofeng_uv5r] Alpha Tags AND Frequencies

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

I combine call sign and location as follows: My general location of Southern Ontario uses two prefixes, VE3xxx and VA3xxx. So rather than replicate the redundant V and 3 in every alpah tag, I assign the first two characters to be a city identifier, eg. WA for Waterloo. Then I follow with the E or A to discriminate the prefix, and finally the 3 characters of the unique callsign.

So a local repeater to me, VE3KSR, for example, becomes WAEKSR, telling me that the full name VE3KSR is in Waterloo. It sounds more complicated than it is. I got used to it very quickly.

Trinity,

Nice website for the knives, but you might want to change "feild radio" to "field radio" (unless that means something else down in LA) - hi, hi.

LOL: That system is not going to work very well here without some modification. My 3 main cities are Chattanooga, Cleveland and Collegedale.

I am of the opinion that each person will have to work out a system that works for them. I do enjoy seeing how others set their system up; sometimes I do find a gem that works for me. In my case, repeaters carry their call sign as the alpha tag AND I have a printed sheet with more notes I can refer to when I have the time.

Bruce W. - KV4OE

>
> Jeff,

Unless I am misunderstanding you, you are misunderstanding that 100% of a channel's programming must done from VFO A. You do not and can not program any channel information while in channel mode.

When you have a working repeater in VFO A, you remain in VFO mode and store the receive frequency and all other settings to an empty channel using menu 27. Then still in VFO mode and using 'reverse mode' to display the transmit frequency or manually keying in the transmit frequency, you write the TX frequency to the same channel as before.

The reason you have to save twice is because the UV-5R does not use shifts and offsets when storing a channel. It only uses, and therefor only stores, the RX frequency and TX frequency. Each in a separate register. If you've only saved once, then you've only created a simplex channel on the repeater's output frequency.

> Karl,

I'll bet Scott nailed it. You need to get farther apart. A 5 watt signal only .600 MHz off frequency from the receiver frequency can render the receiver deaf as a post.

One way to test if the two radios are programmed properly on the repeater channel is to set one and only one of the radios to 'reverse mode'. You do this by tapping the [*SCAN] key. This will put an "R" in the upper status display and swap the RX and TX frequencies on that radio. You should be able to talk between your two radios just like you did on a simplex frequency. Just don't do it very long because you will probably be annoying someone on the repeater. If you want you can put the second radio in 'reverse mode' and exit 'reverse mode' on the first radio try it again. Once you see that this works, then all you should need to do is put some distance between the radios. Using low power will help too. You can toggle High/Low power by tapping the [#LOCK] key.

Note: Those with very old firmware (like mine) will have to set menu 7 (TDR) to OFF before "reverse mode" will engage or the power level toggle will work.

35132. Programming Channels in UVR5A+

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-11 03:32:34 UTC
From: <nunyabidniz2013@...>
Topic: 35132 Message: 35132

Greetings all. I'm having trouble creating channels.

I add frequency "0.0" to Memory Channel 001 successfully. I then go to frequency 0.1, enter Menu27, and save it to Memory Channel 002.

But when I go back to channel mode and scroll through the channels, it retains the last frequency I enter on EVERY channel. AAAARGH! Any ideas?

Jim and all,

I think I MASTERED the agony of not pulling my hair out of my head - following your email below, this was exactly what I was looking for as I just got off the radio with a fellow ham from my hear and had a great QSO with him on one the local repeaters while the radio was in Channel Mode as per your instructions in the last reply you made to me on this everlasting problem - however, the battery finally DIED for the FIRST time, since getting the radio a couple weeks ago, so back to charging the radio one more time after this one and than it's putting it back in the cradle after each use to keep the battery fully charged.

So, looks like I'll have a new radio to play with at this weekend Disaster Relief Trials! Thanks everyone for helping, I think I now have the hang of programming the radio through the keypad versus using the CHIRP software, that will likely be my next thing to get for the radio.

Thanks guys!

73's -

Thank you for the heads up on the spelling error. I just fixed it.

But anyways... yes that’s the company website. I didn’t think it proper to promote my site on here, but since you brought it up, I have Camo uv-5r+ quarto radios and a bunch of accessories for them. Im not the cheapest place to get them. but i deal with all the crap of getting them from china and making sure they work. Its also not my primary income stream. The knives are my bread and butter.

Hoping to sell some of them so i can get myself a personal Yaesu ft-817, as well as diversify my product line, because right now i have all my money wrapped in inventory. I plan on adding some folding portable solar stuff, some aprs/tnc stuff and SDR items to my inventory eventually. If you all have any ideas for stuff you think my customers might have a use for in SHTF, ARIES/RACES/MARS, and similar situations. let me know.

> I am of the opinion that each person will have to
> work out a system that works for them.

EXACTLY!

A system that works one place may be totally worthless somewhere else.

More importantly, a system that works for one user may be totally worthless for another user. Each user needs to find whatever sort of Alpha Tags work best for his or her uses.

For me, some repeaters are named for their location, a few others are named for their sponsor, quite a few are named for their output frequency. In most of these cases, the Alpha Tag that I am using is either the same or a slight shortening of the name most commonly used by local hams to refer to that repeater - in probably 90% of the cases, I could read the Alpha Tag aloud over the air and most of the other local hams hearing it would know exactly what repeater I was talking about.

If you pick Alpha Tags that actually make sense TO YOU, there is generally little need to double-check the frequency. I don't have any objection to people who think they want to see both an alpha tag and the frequency; my comments were simply addressing the fact that it is far easier to change the data in the display using a single menu choice compared with trying to sync the two displays to the same memory channel number.

> frequency for the same memory channel at the same time - ...

Not sure why you suggest "at the same time" ... I have "A" in alpha and "B" in freq. so that I have a simple reminder of what the freq. alpha "name" is whenever I need it. Using the up and down arrows in "A" lets me see the "name" associated with a numeric channel that's displayed in "B". With 128 channels programmed, most of which are used only occasionally, it's a helpful feature, even though one never has the same channel number in both "A" and "B" FYI.

The problem, Gary, is that this technique only works when you are curious about what YOU programmed into some channel.

If you are actually receiving a signal on that channel, you can't both receive the channel and change the channel number in the other display to match. Syncing the two displays to the same channel number has to be done when you are NOT receiving a signal on the channel.

Also check to see if you are in wide or narrow band should be wide. Then make sure you are in 5.0 steps for frequency steps.

Subject: [baofeng_uv5r] Can not get audio through repeaters

Gentlemen; My friend and I just got our new Baofeng UV5R's from Internet sales. Mine is badged as UV5RA+ and his UV5RA. Both work fine on simplex, but only are able to key up local repeater ID's, without any of our audio be passed through! Both radios have been keyboard programed using no tones in receive, on transmit only to access the repeaters. It seems like our radios are not transmitting our audio (speach) to these repeaters. What have we missed here? Bet Jim U. has some ideas. Thanks guys and 73, Karl

The reason, I use Alpha tags is because many times, I won't remember what frequency belongs to who, what and where, it helps my located a needed frequency or two or three when I'm working public service events, usually another ham friend (best friends of course) program our radios the same way that way, if I tell him somethng is somewhere, he knows my radio is programmed the exact way has his and vise versa - but for other's they use their own alpha tag system that suits them, if your going out of area, thats another story for another times at the beer table.

I would think you would be in a great position to hear traffic on the 147.000 repeater. Of course, it may just not be busy when you are listening.

Most repeaters nowadays get used more during the traffic rush to and from work, and sometimes sit idle for hours. If you are seeing the light on the top of the radio indicating a signal but not hearing any audio, then you have a PL tone issue to work through.

Just so you know, 99% of the repeaters just need a tone input but no tone is required for the output. If you have a PL on receive, that's probably why you're not hearing anything on the machine.

It's been many years since we're were in Brisbane, I'm sure it's changed a lot.

Believe me, I understand inventory issues, as my company deals with many
different product lines (although we haven't been asked to supply knives,
at least not yet).

Not only to that - there are some repeaters that are heavily used 24/7 in large areas like Los Angeles and San Francisco, etc., here in Eugene, Or., we have some repeaters that are used just like what Craig explained some are heavily used at different times of the day, including some are used 24/7.

But, there is usually someone sitting on the side of the radio monitoring or the sorts wanting to help a fellow ham trot through the metro area or looking for freqs along his or her route.

im not getting any lights indicating a signal.. ill just keep on listening.
I just received my programming cable today and sucessfully
uploaded AUS_80CH_UHF_CB.dat
Would you think i would expect any transmissions listening to those?

I'm new to this but I would like to use this radio mostly for scanning and partly to talk to a friend (fellow partner) who has a wouxun. this radio does go up to 520 mhz if I'm not mistaken which is what I need to listen to my local ems/fire/pd. I'm an EMT so I like to listen in when I'm not on duty. also is there a way to not transmit on those frequencies. I wouldn't want to transmit accidentally. thank you in advance for your help. p.s. I'm pretty much decided on this because of the price and the fact that it goes up to 520 mhz but would love the feedback.

You're right it is true that steps 4 and 5 are not necessary when programming a memory; because you actually have to work out transmit frequency yourself to program a channel.

Serves me right for reading the Miklor guide.

If you were not going to save the setting to memory, the offset and direction need to be in the settings.

I don't put my method forward as a definitive process - the procedure I posted is one I keep on my phone as an aide-memoire.

Consequently, I made the assumption that saving to 'a' channel, suggests a free channel -

... you can't make a guide fool-proof; fools are so ingenious.

So, a revised method could be:

Memory Programming:
1. VFO-A - enter Rx freq
2. Menu 13 - CTCSS freq
3. Menu 27 - save Rx freq to a memory.
4. Exit
5. VFO-A - set Tx freq
6. Menu 27 - save Tx freq to same memory.
7. Exit.

If you can't enter the frequency you want, it may be necessary to change the step size:
Menu 1 - step size 2.5/5/10 etc

I am assuming a basic level of knowledge, i.e. what VFO-A means, but if an individual can't get past that - hand the radio back and move on!

This is my method of programming:

Repeater Programming:
1. VFO-A - enter Rx freq
2. Menu 1 - step size 2.5/5/10 etc
3. Menu 13 - CTCSS freq
4. Menu 25 - shift + / -
5. Menu 26 - freq offset
6. Menu 27 - save Rx freq to a memory.

7. Exit
8. VFO-A - set Tx freq
9. Menu 27 - save Tx freq to same memory.
10. Exit.

Works for me.

Cheers

Duncan - M0RGO

There is nothing wrong with this except it doesn't tell the new user that the target channel has to be empty. This important detail is left out on a lot of manual programming guides and it causes a lot of frustration because the new user tries to reprogram one of the 20 or so factory programmed channels and it does not work even though the instructions are followed to the letter.

Also step 4 and 5 are not required when programming this way. They can just as easily have been set to OFF and the channel will still be programmed correctly. But doing these steps can be useful if you want to test the other settings on a repeater from the VFO before storing the settings to a channel.

35151. RE: [baofeng_uv5r] H-T Antennas Made Simple

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-11 12:21:43 UTC
From: Michael Black
Topic: 35096 Message: 35151

Yes…I did not use “antenna measurements” although my numbers are easily convertible into uV and dBm and I think I’ll just put down all the calculated measurements in my final report.

My relative measurements in the real world, IMHO, are much better than any theoretical calculations for dBi…at least for my test setup.

You could almost call my 0dB measure 0dBi …. if only I had a theoretical antenna to test in the real world J. I didn’t even bother to put down the claimed gain of any of these antennas as that information is really quite useless for most any practical purpose other than designing antennas. EZNEC, of course, cannot simulate your body at all.

And one major thing…all of your numbers are theoretical….and as it sounds like you already know theoretical gain means little….especially in quarter wave antennas held in your hand.

Your 10W ERP for example is very misleading to those who don’t understand antenna numbers. For 3dBi gain your radio is only putting out 10W in limited directions…so, for example, in a typical HT-to-repeater setup or HT-to-HT you can’t say how these antennas would do very easily as propagation can vary a lot. My test simulates a repeater setup without line of sight due to intervening land which is a very common operating mode. The caveat being YMMV based on the path from point to point quite obviously and could change the ranking of these antennas.

I also tested a rat tail just a little bit and didn’t notice any improvement at all on the rubber ducks…but I didn’t do an extensive test of that as that’s not how most people want to operate with a wire hanging around plus the distance of that wire to your body makes a huge difference and I don’t know of, or heard of, anybody that routinely uses one (you are the first if you actually use that on a daily basis).

I should be testing UHF today and I’m going run 2 tests….one with the UV-5R hand-held normally and then with the external mic and the UV-5R held at arms length or so (I’ll test to see how far away it has to get and then re-use that distance for all antennas).

Mike W9MDB

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of k4ize-bw@...
Sent: Thursday, October 10, 2013 1:55 PM
To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] H-T Antennas Made Simple

Mike’s excellent post the other day contained a lot of good info on antennas that are available commercially. However, you have to have an understanding of what “dB” is and how it works when discussing antennas. Mike's scale is unusual in that it referenced an S-meter reading that is commonly based on micro-volts of received signal. It is not an “antenna” standard.

A change in power by a factor of 10 is a 10 dB change in level. A change in power by a factor of two is approximately a 3 dB change.

dBi (isotropic) is the forward gain of an antenna compared with the hypothetical isotropic antenna, which uniformly distributes energy in all directions.

Imagine for a moment an antenna in space, of no length at all, magically radiating 5W. Its pattern is a perfect sphere, and there is nothing affecting the signal. That is zero dBi. The effective radiating power (ERP) is 5W. Now let's attach an antenna that is rated at 3dBi. The ERP is doubled as though the "transmitter" is now running 10W. It's that simple.

Although there are many commercial antennas available for the Baofeng H-T, there is almost no factual, technical info available about such things as the output impedance (Z) of the radio, or about the feed point of the antenna. It is difficult to make an antenna with a natural Z of 50-Ohms at the end feed point that would be small and practical enough for H-T use on both the 2M and 70cm bands. Any such method would also introduce loss. Quarter-wave antennas are resonant, simple and easy; but, are very high-Z when end-fed.

The following examples are of easily made, inexpensive antennas that provide good gain. Only one is practical for a radio-mounted antenna meant to be easily maneuvered. Values are expressed as (2M / 70cm).

(1) Pseudo-Half-wave Dipole: Gain= 3.8 / 8.6 dBi, SWR= 1.1 on both bands, low takeoff angles.

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). A second moderately flexible 19-in wire (14# stranded) is soldered to the ground side of the same connector, and allowed to trail down where it will. ERP is about 10W on 2M and close to about 15-20W on 70cm.

Antenna-2 is intended to be a portable, collapsible antenna for packing along and set up on a desktop, etc. Performance is similar to Antenna-1 with slightly less gain on 70cm.

Antenna-3 is a fixed, double half-wave antenna on both bands. It has adjustable tuning, is made from 1/2-in self-supporting copper pipe, and is ideal for mounting on a mast on the roof. I know of no better dual band, single element, self-supporting, vertical antenna for gain vs. cost. 5W becomes 50W. I use one on 2M/70cm and another on 6M.

Documentation is available for all the above.

35152. RE: [baofeng_uv5r] New antenna's test report

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-11 13:00:11 UTC
From: Michael Black
Topic: 35112 Message: 35152

Let’s compare your numbers to my real-world test and see how they look. I have tested 5 of your antennas.

Antenna

Your rank

My dB

NA-771

9.5

-4.6

Baofeng U-V85

8

-0.8

NA-701

6

-2.3

Generic J0125A

3.5

-8.7

Baofeng A-5R Logo

3.5

-9.8

That gives us a correlation coefficient of 0.74 (though we have really small sample size here but you can plainly see a pretty decent correlation here).

The one antenna that really doesn’t fit is the NA-771 but I tested 3 of these (which were all physically different) and got wildly varying results of -4.6dB, -3.2dB, and 0dB

If I put the 0dB measurement against yours our correlation goes to 0.95. But my antenna at 0dB was a black sticker on flat black where yours is blue imprint on semigloss black so I put the blue/semi in this chart.

If I just get rid of the NA-771 measurement we have a 0.96 correlation coefficient.

All in all I’d say we’re in agreement except for the NA-771 which doesn’t surprise me with all the variation of that antenna that I’ve seen.

I’ve got 3 different ones:

Model

db at 2.05 Miles 146MHz

Expanded (inches)

Notes

NA-771

0.0

14.9

black sticker flat black

NA-771

-3.2

15.1

blue imprint semigloss black

NA-771

-4.6

15.0

Length is different from other one blue imprint semigloss black

Thought I might get another UV-5R so the non-ham family could chat while we are out together in two cars or at the mall...or wherever. Anyone have experience using the GMRS frequencies? It looks like it could be a lot fun. (I will have to wait until the FCC reopens to get a GMRS license.)

I have been doing a lot of Google research but do not have answers to several questions.

1. Do GMRS repeaters respond like amateur repeaters when you key them? There are a few in my area (Baltimore-Chesapeake Bay) but I don't hear anything.

2. What is a typical range between vehicles using 4 watts? 20? 50? We would be using a typical mag mount on the roof.

I experimented with the attached Nagoya 701 antenna and drove around the neighborhood while my wife listened on my FT-897D at home and reported to me over the cell phone. Seems like one should get at least several miles of coverage with the roof mount.

Hi Mike.. Thanks for your comments ref my antenna test. When I first got interested in radio and electronics in the mid 50's I learned that a db was a unit of gain or loss as compared to some stated value and not a finite value in itself. So it is a bit difficult for me to understand your readings. This is not criticism, just my lack of understanding. So your findings are a bit confusing to me. But thanks for your comments that show we have some correlation in our reports.

You're right.dB is relative..but scaled the same as dBm.

I could've showed dBm too. Just subtract 73 from each value. That was in my original report on this.

I showed it this way due to due to the S Meter Lite software calibration routine expecting S9=0dB, so S9=0dB=50uV=-73dBm.

So the values are the same as the software puts out (avoids transcribing errors.let the spreadsheet calculate dBm).

I'll put a dBm column in the final report too. I thought the S Meter Lite scale was a bit easier to visualize with the normalization to S9=0dB too instead of all negative dBm readings.

So both columns will let users choose.

Hi everyone,

Does anyone know where to get replacement ear pads for the head set that comes with the UV-5R Plus?

I bought my radio on Amazon, and the pad came off the ear bud on the head set. When I tried to put it back on, it tore.

I'm also open to suggestions for different types of head sets, if any one has recommendations.

Since the Baofeng uses the standard Kenwood plug your options are nearly endless. I got an over the ear type with one of my radios and it is my preferred unit for general use. For dedicated use like calling the net I like my headset with boom mike. That one was from China via eBay and well worth the $16.00 US even if it only has one speaker. Options abound and there is something for most any price point.

For quick US shipping this item might be worth consideration

im not getting any lights indicating a signal.. ill just keep on listening. I just received my programming cable today and sucessfully uploaded AUS_80CH_UHF_CB.dat
Would you think i would expect any transmissions listening to those?

On Fri, Oct 11, 2013 at 3:43 PM, Craig Carnahan <craig.n7lb@...> wrote: I would think you would be in a great position to hear traffic on the 147.000 repeater. Of course, it may just not be busy when you are listening. Most repeaters nowadays get used more during the traffic rush to and from work, and sometimes sit idle for hours. If you are seeing the light on the top of the radio indicating a signal but not hearing any audio, then you have a PL tone issue to work through. Just so you know, 99% of the repeaters just need a tone input but no tone is required for the output. If you have a PL on receive, that's probably why you're not hearing anything on the machine.
It's been many years since we're were in Brisbane, I'm sure it's changed a lot.

Topic: 35096 Message: 35163

I'm sorry, Mike, you seem to have been offended. I think your tests and results are far better than others I have seen. I did not use the term "rattail" for good reason. All my examples are based on resonant antennas. Virtually none of the commercial antennas available are anywhere near resonant. They are "forced" radiators by appending a length of conductor to a "tuner" built in either the base, or even the radio. Hanging a rattail on a non-resonant radiator is useless. It must be a 1/4 wave added to a 1/4 wave to create a center fed dipole. Or, tuned to whatever is being used. And, it works great with about 19" of antenna with the same length of rattail. Since the pattern is larger, and equal up and down, it helps negate the effect of your head. When working "in the field" you will never notice the wire.

My post was meant to compliment yours (and others) by introducing theoretical-based design. Theory is everything. To not rely on theory is to gamble in the dark. The three examples I offered are for those who need something better. The half-wave (rattail) dipole is far better than any radio-mounted antenna you can buy, and still get in and out of a car!. If I were working an emergency, it would be my choice. If I'm just playing ham radio, I will use the factory (or similar) antenna.

A lot of the past posts have asked for advice as to which.outdoor or roof mounted antenna to buy. The j-pole I referenced is by far the best bang for the buck you will find at about $50. It is truly resonant on both bands with lots of gain and a very low take-off angle. Email me if you wan the actual design of the example antennas. All three are 1-day of fun!

Since we are into being critical, I will suggest that you would have been better off using the same methods, but different values and scales where the reference would be "zero" for the factory antenna and not use "dB'. Keep the target audience in mind.

Speaking of that, this is my parting shot. I will stick around for a few days in case anyone wants more info, then I am leaving this forum. I am on way too many, and moderator on some.

Y'all have fun - that's the objective. 73,

Yes…I did not use “antenna measurements” although my numbers are easily convertible into uV and dBm and I think I’ll just put down all the calculated measurements in my final report. My relative measurements in the real world, IMHO, are much better than any theoretical calculations for dBi…at least for my test setup.
You could almost call my 0dB measure 0dBi …. if only I had a theoretical antenna to test in the real world J. I didn’t even bother to put down the claimed gain of any of these antennas as that information is really quite useless for most any practical purpose other than designing antennas. EZNEC, of course, cannot simulate your body at all.

And one major thing…all of your numbers are theoretical….and as it sounds like you already know theoretical gain means little….especially in quarter wave antennas held in your hand. Your 10W ERP for example is very misleading to those who don't understand antenna numbers. For 3dBi gain your radio is only putting out 10W in limited directions…so, for example, in a typical HT-to-repeater setup or HT-to-HT you can't say how these antennas would do very easily as propagation can vary a lot. My test simulates a repeater setup without line of sight due to intervening land which is a very common operating mode. The caveat being YMMV based on the path from point to point quite obviously and could change the ranking of these antennas.

I also tested a rat tail just a little bit and didn't notice any improvement at all on the rubber ducks…but I didn't do an extensive test of that as that's not how most people want to operate with a wire hanging around plus the distance of that wire to your body makes a huge difference and I don't know of, or heard of, anybody that routinely uses one (you are the first if you actually use that on a daily basis).

I should be testing UHF today and I'm going run 2 tests….one with the UV-5R hand-held normally and then with the external mic and the UV-5R held at arms length or so (I'll test to see how far away it has to get and then re-use that distance for all antennas).

Subject: [baofeng_uv5r] H-T Antennas Made Simple

Mike's excellent post the other day contained a lot of good info on antennas that are available commercially. However, you have to have an understanding of what "dB" is and how it works when discussing antennas. Mike's scale is unusual in that it referenced an S-meter reading that is commonly based on micro-volts of received signal. It is not an "antenna" standard.

A change in power by a factor of 10 is a 10 dB change in level. A change in power by a factor of two is approximately a 3 dB change.

dBi (isotropic) is the forward gain of an antenna compared with the hypothetical isotropic antenna, which uniformly distributes energy in all directions.

Imagine for a moment an antenna in space, of no length at all, magically radiating 5W. Its pattern is a perfect sphere, and there is nothing affecting the signal. That is zero dBi. The effective radiating power (ERP) is 5W. Now let's attach an antenna that is rated at 3dBi. The ERP is doubled as though the "transmitter" is now running 10W. It's that simple.

Although there are many commercial antennas available for the Baofeng H-T, there is almost no factual, technical info available about such things as the output impedance (Z) of the radio, or about the feed point of the antenna. It is difficult to make an antenna with a natural Z of 50-Ohms at the end feed point that would be small and practical enough for H-T use on both the 2M and 70cm bands. Any such method would also introduce loss. Quarter-wave antennas are resonant, simple and easy; but, are very high-Z when end-fed.

The following examples are of easily made, inexpensive antennas that provide good gain. Only one is practical for a radio-mounted antenna meant to be easily maneuvered. Values are

expressed as (2M / 70cm).

(1) Pseudo-Half-wave Dipole: Gain= 3.8 / 8.6 dBi, SWR= 1.1 on both bands, low takeoff angles.

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). A second moderately flexible 19-in wire (14# stranded) is soldered to the ground side of the same connector, and allowed to trail down where it will. ERP is about 10W on 2M and close to about 15-20W on 70cm.

Antenna-2 is intended to be a portable, collapsible antenna for packing along and set up on a desktop, etc. Performance is similar to Antenna-1 with slightly less gain on 70cm.

Antenna-3 is a fixed, double half-wave antenna on both bands. It has adjustable tuning, is made from 1/2-in self-supporting copper pipe, and is ideal for mounting on a mast on the roof. I know of no better dual band, single element, self-supporting, vertical antenna for gain vs. cost. 5W becomes 50W. I use one on 2M/70cm and another on 6M.

Documentation is available for all the above.

I do not think Mike has been offended, and neither should you be.

There are a lot of folks here that want to learn, that are newbies like me , as well as experienced individuals like yourself and Mike who are trying to share their knowledge.

even as a newbie, I have given Mike suggestions, due to my lack of understanding, and I look forward to his data.

at the same time, I would be interested in learning more about the antennas you mentioned, since besides a better HT antenna, I am interested in one for the house.

Thanks

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). A second moderately flexible 19-in wire (14# stranded) is soldered to the ground side of the same connector, and allowed to trail down where it will. ERP is about 10W on 2M and close to about 15-20W on 70cm.

Antenna-2 is intended to be a portable, collapsible antenna for packing along and set up on a desktop, etc. Performance is similar to Antenna-1 with slightly less gain on 70cm.

Antenna-3 is a fixed, double half-wave antenna on both bands. It has adjustable tuning, is made from 1/2-in self-supporting copper pipe, and is ideal for mounting on a mast on the roof. I know of no better dual band, single element, self-supporting, vertical antenna for gain vs. cost. 5W becomes 50W. I use one on 2M/70cm and another on 6M.

Documentation is available for all the above.

You're right…not offended at all. All constructive criticism is more than welcome.

I'm curious why you think dB is a bad scale (you did say not to use "dB") since all the units are actually calibrated decibels. You can, of course, make them relevant to whatever base value you want which is why I'll include dBm this time.

Can't, of course, use dBi since I can't measure a real one (pun intended :-).

I did not use any antenna as the 0dB reference – I used 0db=50uV…the scale is actually in decibels. It's just an artifact of the S Meter Lite program.

I just finished a UHF test and will post all these results soon (either today or tomorrow)

Bill

I do not think Mike has been offended, and neither should you be.

There are a lot of folks here that want to learn, that are newbies like me , as well as experienced individuals like yourself and Mike who are trying to share their knowledge.

even as a newbie, I have given Mike suggestions, due to my lack of understanding, and I look forward to his data.

at the same time, I would be interested in learning more about the antennas you mentioned, since besides a better HT antenna, I am interested in one for the house.

Thanks

On Friday, October 11, 2013 12:01 PM, "k4ize-bw@..." <k4ize-bw@...> wrote:

I'm sorry, Mike, you seem to have been offended. I think your tests and results are far better than others I have seen. I did not use the term "rattail" for good reason. All my examples are based on resonant antennas. Virtually none of the commercial antennas available are anywhere near resonant. They are "forced" radiators by appending a length of conductor to a "tuner" built in either the base, or even the radio. Hanging a rattail on a non-resonant radiator is useless. It must be a 1/4 wave added to a 1/4 wave to create a center fed dipole. Or, tuned to whatever is being used. And, it works great with about 19" of antenna with the same length of rattail. Since the pattern is larger, and equal up and down, it helps negate the effect of your head. When working "in the field" you will never notice the wire.

My post was meant to compliment yours (and others) by introducing theoretical-based design. Theory is everything. To not rely on theory is to gamble in the dark. The three examples I offered are for those who need something better. The half-wave (rattail) dipole is far better than any radio-mounted antenna you can buy, and still get in and out of a car!. If I were working an emergency, it would be my choice. If I'm just playing ham radio, I will use the factory (or similar) antenna.

A lot of the past posts have asked for advice as to which.outdoor or roof mounted antenna to buy. The j-pole I referenced is by far the best bang for the buck you will find at about $50. It is truly resonant on both bands with lots of gain and a very low take-off angle. Email me if you wan the actual design of the example antennas. All three are 1-day of fun!

Since we are into being critical, I will suggest that you would have been better off using the same methods, but different values and scales where the reference would be "zero" for the factory antenna and not use "dB'. Keep the target audience in mind.

Speaking of that, this is my parting shot. I will stick around for a few days in case anyone wants more info, then I am leaving this forum. I am on way too many, and moderator on some.

Y'all have fun - that's the objective. 73,

Bill - K4IZE

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

Yes…I did not use “antenna measurements” although my numbers are easily convertible into uV and dBm and I think I’ll just put down all the calculated measurements in my final report.

My relative measurements in the real world, IMHO, are much better than any theoretical calculations for dBi…at least for my test setup.

You could almost call my 0dB measure 0dBi …. if only I had a theoretical antenna to test in the real world J. I didn’t even bother to put down the claimed gain of any of these antennas as that information is really quite useless for most any practical purpose other than designing antennas. EZNEC, of course, cannot simulate your body at all.

And one major thing…all of your numbers are theoretical….and as it sounds like you already know theoretical gain means little….especially in quarter wave antennas held in your hand.

Your 10W ERP for example is very misleading to those who don’t understand antenna numbers. For 3dBi gain your radio is only putting out 10W in limited directions…so, for example, in a typical HT-to-repeater setup or HT-to-HT you can’t say how these antennas would do very easily as propagation can vary a lot. My test simulates a repeater setup without line of sight due to intervening land which is a very common operating mode. The caveat being YMMV based on the path from point to point quite obviously and could change the ranking of these antennas.

I also tested a rat tail just a little bit and didn’t notice any improvement at all on the rubber ducks…but I didn’t do an extensive test of that as that’s not how most people want to operate with a wire hanging around plus the distance of that wire to your body makes a huge difference and I don’t know of, or heard of, anybody that routinely uses one (you are the first if you actually use that on a daily basis).

I should be testing UHF today and I'm going run 2 tests….one with the UV-5R hand-held normally and then with the external mic and the UV-5R held at arms length or so (I'll test to see how far away it has to get and then re-use that distance for all antennas).

Subject: [baofeng_uv5r] H-T Antennas Made Simple

Mike's excellent post the other day contained a lot of good info on antennas that are available commercially. However, you have to have an understanding of what "dB" is and how it works when discussing antennas. Mike's scale is unusual in that it referenced an S-meter reading that is commonly based on micro-volts of received signal. It is not an "antenna" standard.

A change in power by a factor of 10 is a 10 dB change in level. A change in power by a factor of two is approximately a 3 dB change.

dBi (isotropic) is the forward gain of an antenna compared with the hypothetical isotropic antenna, which uniformly distributes energy in all directions.

Imagine for a moment an antenna in space, of no length at all, magically radiating 5W. Its pattern is a perfect sphere, and there is nothing affecting the signal. That is zero dBi. The effective radiating power (ERP) is 5W. Now let's attach an antenna that is rated at 3dBi. The ERP is doubled as though the "transmitter" is now running 10W. It's that simple.

Although there are many commercial antennas available for the Baofeng H-T, there is almost no factual, technical info available about such things as the output impedance (Z) of the radio, or about the feed point of the antenna. It is difficult to make an antenna with a natural Z of 50-Ohms at the end feed point that would be small and practical enough for H-T use on both the 2M and 70cm bands. Any such method would also introduce loss. Quarter-wave antennas are resonant, simple and easy; but, are very high-Z when end-fed.

The following examples are of easily made, inexpensive antennas that provide good gain. Only one is practical for a radio-mounted antenna meant to be easily maneuvered. Values are expressed as (2M / 70cm).

(1) Pseudo-Half-wave Dipole: Gain= 3.8 / 8.6 dBi, SWR= 1.1 on both bands, low takeoff angles.

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). I'm having trouble with one of the repeaters near my home in Nashville, TN, 145.490. People can hear me but I can't hear them. They tell me that they suspect that I have some kind of receive squelch on but I haven't been able to find it. The Tone Mode column in CHIRP is set to (None). Picture attached Line 17.

Can anyone suggest what I should try next?

Thanks,
Evans Martin

I am sing UV-5R Plus and -5RE, 5B

What is the newest version? I would think you want the one with the newest firmware update.

35173. About decibels + some SI matters

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-11 20:20:28 UTC
From: Bruce Prior
Topic: 35173 Message: 35173

First let's talk about the term <decibel> or plural
<decibels>. That is a unit in the
International System of Units (SI) which was named after Alexander Graham Bell,
who not only developed the telephone, but he also made significant
contributions to the hearing-impaired community. See http://en.wikipedia.org/wiki/Decibel.
Although the title of the Wikipedia article
capitalizes decibel, it should be written in lower case.

The root unit is the <bel>, with an SI symbol
<B> (Notice the upper-case B for the symbol, which is typical of SI
symbols which are named after a person.
Other examples are V for volt, A for ampere, C for coulomb, etc. A decibel, with the SI
symbol <dB> is
1/10 of a bel. (Note the lower-case <d> and the upper-case <B>.) So 30 decibels is the same
value as 3
bels.

I find that bels are easier to grasp than decibels. The bel is used to compare the strength
or
power or intensity of some physical quantity with another standard. It is logarithmic. It
is actually 10 to the power of x (10x),
where x is the quantity expressed in bels.
So, 50 decibels is the same as 5 bels or 105 or 100 000. A quantity of 50 decibels is 100
000 times
stronger or more intense than some standard quantity. (Note that long integers or fractions
in SI
are separated by spaces or half-spaces rather than commas. That's because either the dot
<.> or the
comma <,> can be used as a decimal marker in SI. 144,390 kHz is not the well-known APRS
frequency on the 2-meter band. It is the
same as 144.390 kHz, which is well below the AM broadcast band.) To listen to 1200-baud
digital bursts of APRS
packets, tune your Baofeng UV-5RE transceiver to 144.390 MHz or 144 390 kHz,
also written 144 390 kilohertz. You need
a modem to translate the digital signal.
Margaret K7MWP and I recently returned from a trip to Vancouver
Island, where I was operating my APRS rig with my Canadian call
sign VE7HR. See
http://aprs.fi/#!mt=roadmap&z=15&call=a%2FVE7HR&timerange=345600&tail=345600
. Perhaps someone on this list knows of
a computer mobile device application which will demodulate 1200-baud APRS
packets using simple audio coupling with your Beofeng UV-5FE transceiver.

Lots of radio amateurs misuse the SI symbol dB by adding a
suffix to it, like 6 dBd. Although you
will see expressions like that frequently, even in ARRL publications, they are

incorrect. "6 dBd" should read
something like "6 dB gain compared to a half-wavelength dipole antenna in
free space." Adding suffixes to SI symbols is not correct.

For more details about SI or the International System of
Units, study http://en.wikipedia.org/wiki/International_System_of_Units
. The National Institute of Standards
and Technology, or NIST, is the designated SI authority in the USA. Normally the NIST website is an excellent
source of information about SI, but NIST and its website is currently closed
because of the US
government shutdown. A similar entity in
the United Kingdom
is the National Physical Laboratory. See
http://www.npl.co.uk/reference/measurement-units/si-conventions/
for an authoritative perspective on SI. The
National Measurement Institute does the same job in Australia. See http://www.measurement.gov.au/measurementsystem/Pages/HowAustraliasMeasurementSystemWorks.aspx for details.

So, what does "6 dB" or "-60 dB"
mean? To answer that, pull out your
scientific calculator. It might have a
function called <10x> or <yx>. First convert the decibels to bels:

6 dB = 0.6 B and

-60 dB = -6 B

Now plug those values into your scientific calculator.

100.6 = 3.98

10-6 = 0.000 001

Since the Baofeng uses the standard Kenwood plug your options are nearly endless. I got an over the ear type with one of my radios and it is my preferred unit for general use. For dedicated use like calling the net I like my headset with boom mike. That one was from China via eBay and well worth the $16.00 US even if it only has one speaker. Options abound and there is something for most any price point.

For quick US shipping this item might be worth consideration

I'd recommend NOT charging the battery after every use. Your supposed to "condition " the battery by charging, then letting it discharge(though normal use) then rechargin 3 time. Some batteries do not like to be on constant charge and it can shorten the life of your battery. You might want to look into a battery eliminator and a 12 volt power supply.

Subject: Re: [baofeng_uv5r] Transmit problem after programming?

Jim and all,

I think I MASTERED the agony of not pulling my hair out of my head - following your email below, this was exactly what I was looking for as I just got off the radio with a fellow ham from my hear and had a great QSO with him on one the local repeaters while the radio was in Channel Mode as per your instructions in the last reply you made to me on this everlasting problem - however, the battery finally DIED for the FIRST time, since getting the radio a couple weeks ago, so back to charging the radio one more time after this one and than it's putting it back in the cradle after each use to keep the battery fully charged.

So, looks like I'll have a new radio to play with at this weekend Disaster Relief Trials! Thanks everyone for helping, I think I now have the hang of programming the radio through the keypad versus using the CHIRP software, that will likely be my next thing to get for the radio.

Thanks guys!

73's -

Jim, I will have Ben email you the CHIRP image he used. I also did a clean swipe of everything that was programmed in the radio and tried programming it by hand, problem is, I had no problem getting them set up in the freq mode, but when I get to the channel mode it just doesn't want to save what I had in freq mode to channel mode - without having to do the process over again for the tx/tx to make the repeater work in channel mode.

Jeff - KE7OUR

Jeff,

Unless I am misunderstanding you, you are misunderstanding that 100% of a channel's programming must done from VFO A. You do not and can not program any channel information

while in channel mode.

When you have a working repeater in VFO A, you remain in VFO mode and store the receive frequency and all other settings to an empty channel using menu 27. Then still in VFO mode and using 'reverse mode' to display the transmit frequency or manually keying in the transmit frequency, you write the TX frequency to the same channel as before.

The reason you have to save twice is because the UV-5R does not use shifts and offsets when storing a channel. It only uses, and therefor only stores, the RX frequency and TX frequency. Each in a separate register. If you've only saved once, then you've only created a simplex channel on the repeater's output frequency.

Evans,
Your CHIRP entry looks OK to me.

One thing that you can try is pressing the [MONI] button when receiving on
that channel. It bypasses DCS, CTCSS and carrier squelch on the receiver.

Another would be to give the "Erratic Behavior and Recovery" procedure on
the Miklor.com website a try. Just backup what you have before trying it.
Copy and paste your channels between tabs in CHIRP. If it works, then don't
ever load you backup file into your radio again or the problem will be
restored.

There really isn't a newest version. All the R+, RE, B, etc indicates the case that the exact same electronics was packaged in. There really hasn't been any firmware changes in the last 5 or 6 releases that have made any changes that are noticeable by the user. To be honest, there haven't been any firmware revisions made over the life of the radio that I would recommend choosing any one over another.

Topic: 35096 Message: 35178

Good! I am glad no one is offended. I think we are approaching this from two different directions. Mike is an engineer while I am a design-build guy. I simply thought that all the big numbers were a little hard to wrap my very senior mind around. To me, the zero mV reference is a bit hard to relate to antennas. I think your efforts are more related to this group than mine are. It just seems that if someone is interested in improving the performance of the factory combo, he needs to build something that will not be in negative numbers. The factory antenna works fine for casual use and little is gained (pun intended) by buying another lossy antenna.

If you want base station performance out of a $30 radio and antenna, something needs to change - that something is convenience. You can build a decent antenna with a thin 19" brass wire or welding rod soldered to the center of a PL-259. Add the 19" tail to the ground side and you get close to twice the performance on both bands. And, you can still run through the woods with it! When you want to look cool, just unscrew the homemade dipole and put the original back on.

As for a real base station antenna, build the J-pole. Mount it to your chimney, or on a tall mast or pole and feed it with good coax - not RG-58 from the Shack. There are a ton of plans on the internet; but, most are not as good as the one I independently came up with. I do not claim to have invented it - just improved on what I wanted. It ain't a shorty!! If it fails to satisfy your needs, buy a Mirage amplifier and buy a commercial colinear for about $200.

I think we have resolved what Mike and I started out to accomplish. You now have the info to make choices. Again, if anyone wants drawings, plans, charts, whatever, email me direct at

k4ize-bw@att.net

I will be traveling some (with the UV-5R) so be patient. I answer all friendly emails. A very 73 to all who participated. I will be leaving this behind as I am getting too busy with too many forums. Have fun!

Bill

You’re right…not offended at all. All constructive criticism is more than welcome.
I’m curious why you think dB is a bad scale (you did say not to use “dB”) since all the units are actually calibrated decibels. You can, of course, make them relevant to whatever base value you want which is why I’ll include dBm this time.
Can’t, of course, use dBi since I can’t measure a real one (pun intended :-).
I did not use any antenna as the 0dB reference – I used 0db=50uV…the scale is actually in decibels. It’s just an artifact of the S Meter Lite program.
I just finished a UHF test and will post all these results soon (either today or tomorrow)

Bill

I do not think Mike has been offended, and neither should you be.

There are a lot of folks here that want to learn, that are newbies like me , as well as experienced individuals like yourself and Mike who are trying to share their knowledge.

even as a newbie, I have given Mike suggestions, due to my lack of understanding, and I look forward to his data.

at the same time, I would be interested in learning more about the antennas you mentioned, since besides a better HT antenna, I am interested in one for the house.

Thanks

I'm sorry, Mike, you seem to have been offended. I think your tests and results are far better than others I have seen. I did not use the term "rattail" for good reason. All my examples are based on resonant antennas. Virtually none of the commercial antennas available are anywhere near resonant. They are "forced" radiators by appending a length of conductor to a "tuner" built in either the base, or even the radio. Hanging a rattail on a non-resonant radiator is useless. It must be a 1/4 wave added to a 1/4 wave to create a center fed dipole. Or, tuned to whatever is being used. And, it works great with about 19" of antenna with the same length of rattail. Since the pattern is larger, and equal up and down, it helps negate the effect of your head. When working "in the field" you will never notice the wire.

My post was meant to compliment yours (and others) by introducing theoretical-based design. Theory is everything. To not rely on theory is to gamble in the dark. The three examples I offered are for those who need something better. The half-wave (rattail) dipole is far better than any radio-mounted antenna you can buy, and still get in and out of a car!. If I were working an emergency, it would be my choice. If I'm just playing ham radio, I will use the factory (or similar) antenna.

A lot of the past posts have asked for advice as to which.outdoor or roof mounted antenna to buy. The j-pole I referenced is by far the best bang for the buck you will find at about $50. It is truly resonant on both bands with lots of gain and a very low take-off angle. Email me if you wan the actual design of the example antennas. All three are 1-day of fun!

Since we are into being critical, I will suggest that you would have been better off using the same methods, but different values and scales where the reference would be "zero" for the factory antenna and not use "dB'. Keep the target audience in mind.

Speaking of that, this is my parting shot. I will stick around for a few days in case anyone wants more info, then I am leaving this forum. I am on way too many, and moderator on some.

Y'all have fun - that's the objective. 73,

Bill - K4IZE

---In baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com, <mdblack98@... mailto:mdblack98@...> wrote:
Yes…I did not use “antenna measurements” although my numbers are easily convertible into uV and dBm and I think I’ll just put down all the calculated measurements in my final report.

My relative measurements in the real world, IMHO, are much better than any theoretical calculations for dBi…at least for my test setup.

You could almost call my 0dB measure 0dBi …. if only I had a theoretical antenna to test in the real world J. I didn’t even bother to put down the claimed gain of any of these antennas as that information is really quite useless for most any practical purpose other than designing antennas. EZNEC, of course, cannot simulate your body at all.

And one major thing…all of your numbers are theoretical….and as it sounds like you already know theoretical gain means little….especially in quarter wave antennas held in your hand.

Your 10W ERP for example is very misleading to those who don’t understand antenna numbers. For 3dBi gain your radio is only putting out 10W in limited directions…so, for example, in a typical HT-to-repeater setup or HT-to-HT you can’t say how these antennas would do very easily as propagation can vary a lot. My test simulates a repeater setup without line of sight due to intervening land which is a very common operating mode. The caveat being YMMV based on the path from point to point quite obviously and could change the ranking of these antennas.

I also tested a rat tail just a little bit and didn’t notice any improvement at all on the rubber ducks…but I didn’t do an extensive test of that as that’s not how most people want to operate with a wire hanging around plus the distance of that wire to your body makes a huge difference and I don’t know of, or heard of, anybody that routinely uses one (you are the first if you actually use that on a daily basis).

I should be testing UHF today and I’m going run 2 tests….one with the UV-5R hand-held normally and then with the external mic and the UV-5R held at arms length or so (I’ll test to see how far away it has to get and then re-use that distance for all antennas).

Subject: [baofeng_uv5r] H-T Antennas Made Simple

Mike’s excellent post the other day contained a lot of good info on antennas that are available commercially. However, you have to have an understanding of what “dB” is and how it works when discussing antennas. Mike's scale is unusual in that it referenced an S-meter reading that is commonly based on micro-volts of received signal. It is not an “antenna” standard.

A change in power by a factor of 10 is a 10 dB change in level. A change in power by a factor of two is approximately a 3 dB change.

dBi (isotropic) is the forward gain of an antenna compared with the hypothetical isotropic antenna, which uniformly distributes energy in all directions.

Imagine for a moment an antenna in space, of no length at all, magically radiating 5W. Its pattern is a perfect sphere, and there is nothing affecting the signal. That is zero dBi. The effective radiating power (ERP) is 5W. Now let's attach an antenna that is rated at 3dBi. The ERP is doubled as though the "transmitter" is now running 10W. It's that simple.

Although there are many commercial antennas available for the Baofeng H-T, there is almost no factual, technical info available about such things as the output impedance (Z) of the radio, or about the feed point of the antenna. It is difficult to make an antenna with a natural Z of 50-Ohms at the end feed point that would be small and practical enough for H-T use on both the 2M and 70cm bands. Any such method would also introduce loss. Quarter-wave antennas are resonant, simple and easy; but, are very high-Z when end-fed.

The following examples are of easily made, inexpensive antennas that provide good gain. Only one is practical for a radio-mounted antenna meant to be easily maneuvered. Values are expressed as (2M / 70cm).

(1) Pseudo-Half-wave Dipole: Gain= 3.8 / 8.6 dBi, SWR= 1.1 on both bands, low takeoff angles.

(2) Quarter-wave Ground Plane: Gain= 3.75 / 5.6 dBi, SWR= 1:1.2 / 1:1.7 moderate takeoff angles

(3) J-pole for Fixed Location: Gain= 10.3 / 10.23 dBi; SWR= 1:1.2 / 1:1.7 Excellent gain and takeoff angles

I have built and tested all of these antennas under real-world conditions. They really work. All were designed first on EZNEC, then built and tuned. I used an SMA/UHF adaptor for ease of attachment.

Antenna-1 is a simple 19-in stiff wire soldered to a UHF male connector center pin (PL-259). A second moderately flexible 19-in wire (14# stranded) is soldered to the ground side of the same connector, and allowed to trail down where it will. ERP is about 10W on 2M and close to about 15-20W on 70cm.

Antenna-2 is intended to be a portable, collapsible antenna for packing along and set up on a desktop, etc. Performance is similar to Antenna-1 with slightly less gain on 70cm.

Antenna-3 is a fixed, double half-wave antenna on both bands. It has adjustable tuning, is made from 1/2-in self-supporting copper pipe, and is ideal for mounting on a mast on the roof. I know of no better dual band, single element, self-supporting, vertical antenna for gain vs. cost. 5W becomes 50W. I use one on 2M/70cm and another on 6M.

Documentation is available for all the above.

I think you may just be experiencing a difference in antenna radiation pattern.

If I got the addresses right for from you to KU4B this is the elevation profile between you.

So you aren't line of sight. And he's about 14 miles away.

You're lucky you can key his repeater at all. His antenna may not radiate well back to you with that +30 foot land peak a couple of miles from you. And I don't see a listing of what antenna he's running.

I'll bet if you drive a few miles SE you can hear it just fine. Or get an antenna on your roof and you'll probably be OK too.

Actually that isn't quite true. You can easily program a memory channel without needing to "work out transmit frequency yourself" simply be setting the correct offset in the VFO - but you DO still need to save the receive and transmit frequencies separately.

One advantage to using the offset in VFO mode when manually programming memory channels is that you can check that ALL your settings are correct by accessing the repeater in VFO mode before saving those settings to a memory channel.

Why not just set the channel to not transmit at all?

> Also check to see if you are in wide or narrow band should be wide.

That is PROBABLY (but not necessarily) true on the ham bands (and absolutely wrong on Part 90 frequencies). In any case, this CANNOT be the cause of his problem. At most, having narrow band set on a repeater configured for wide band would give LOW audio, but certainly not a complete lack of audio.

> Then make sure you are in 5.0 steps for frequency steps.

ANY step size that lets him have the proper frequency will work fine. If he is accessing the repeater, then he must already have a usable step size so the step size CANNOT be the cause of his problem.

By the way, 2.5 is a better choice than 5.0 for most users because it will access ALL the potential frequencies.

As many have already explained, the most likely cause of his perceived problem is simply that the radio his is using to transmit is desensing the radio he is using to receive.

Other possibilities could be a defective microphone in the radio, a defective case with NO hole over the microphone, or a defective mic plug on the radio. These have all been known to happen, but they are much less common than simple desensing of the receiver.

That's awesome data, Mike! Where did you get the graph? I can see where
that info would come in handy all the time.

The unfortunate part is that I DO have an antenna on my roof. I guess I
need to add some additional height to it.

Thanks again for the info,

Since the Baofeng uses the standard Kenwood plug your options are nearly
endless. I got an over the ear type with one of my radios and it is my
preferred unit for general use. For dedicated use like calling the net I
like my headset with boom mike. That one was from China via eBay and well
worth the $16.00 US even if it only has one speaker. Options abound and
there is something for most any price point.

For quick US shipping this item might be worth consideration

The radio can be purchased from Amazon.com delivered to your door for $36. Let's say it costs $4 to get it to you. Then that leaves $32 for the radio itself. Most of that cost goes into the 4 major components (radio, antenna, battery and battery charger). And don't forget some is going to Amazon and the Seller. Did you really expect to be impressed by the headset?

I use CHIRP here, but it is easy to set a channel to TX inhibited using the
Baofeng software if that is what you want to use.

1. enter the RX frequency into the RX frequency column (the software
instantly populates the TX frequency column with the same frequency so you
don't have to enter anything if you are creating a simplex channel)
2. delete the TX frequency from the TX frequency column so that it is blank
3. fill in the remaining channel data
4. upload to radio

EVANS,

LETS LOOK AT THIS REALISTICALLY. YOU HAVE A RADIO THAT PUTS OUT 4 WATTS IF YOU ARE LUCKY. A REPEATER PUTS OUT 50-100 WATTS. YOU HAVE A 5" ANTENNA, THE REPEATER PROBABLY HAS 6+ FEET. IF YOU CAN BE HEARD OUT OF THE REPEATER THERE IS ABSOLUTELY NO REASON YOU SHOULD NOT HEAR THE REPEATER. UNLESS YOU ARE RIGHT ON TOP OF IT.

I HAVE 6 OR MORE DIFFERENT HTS, THEY ALL DO THE SAME THING, I CAN'T GET INTO A PARTICULAR REPEATER BUT I CAN HEAR IT JUST FINE.

I WOULD SAY YOU DEFINITELY HAVE A RECEIVE PROBLEM.

73 de ZIPPY,

I think you may just be experiencing a difference in antenna radiation pattern.

If I got the addresses right for from you to KU4B this is the elevation profile between you.

So you aren’t line of sight. And he’s about 14 miles away.
You’re lucky you can key his repeater at all. His antenna may not radiate well back to you with that +30 foot land peak a couple of miles from you. And I don’t see a listing of what antenna he’s running.
I’ll bet if you drive a few miles SE you can hear it just fine. Or get an antenna on your roof and you’ll probably be OK too.

Mike W9MDB

I don't think that is right. That repeater is suppose to be on Short Mountain.

From: <n7kuw@...>
Topic: 35153 Message: 35193

The Part 95 issues notwithstanding (and I'm not advocating ignoring that requirement), GMRS behaves/acts almost exactly the same as the 70cm ham band (it is about 20MHz higher, same band).

If you are using 4 watt radios with an external antenna on your vehicles, you should expect 1/2 mile to 2 or 3 miles. If you get higher power mobile radios, 35 to 45 watt range, you will maybe double your range.

GMRS repeaters are like amateur repeaters in many ways. The input will be 5 MHz above the output (so the lowest GMRS pair is 462.550 / 467.550). Most or all will be tone guarded (you need to use the correct CTCSS or DCS code). And most expect you to have permission of the owner to use.

One obvious advantage to GMRS is your entire family is covered by your license. Probably the biggest disadvantage is that there are not very many GMRS repeaters around, nowhere near as many as amateur repeaters.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Thought I might get another UV-5R so the non-ham family could chat while we are out together in two cars or at the mall...or wherever. Anyone have experience using the GMRS frequencies? It looks like it could be a lot fun. (I will have to wait until the FCC reopens to get a GMRS license.)

I have been doing a lot of Google research but do not have answers to several questions.

1. Do GMRS repeaters respond like amateur repeaters when you key them? There are a few in my area (Baltimore-Chesapeake Bay) but I don't hear anything.

2. What is a typical range between vehicles using 4 watts? 20? 50? We would be using a typical mag mount on the roof.

I experimented with the attached Nagoya 701 antenna and drove around the neighborhood while my wife listened on my FT-897D at home and reported to me over the cell phone. Seems like one should get at least several miles of coverage with the roof mount.

35194. RE: About decibels + some SI matters

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-12 04:40:47 UTC
From: <n7rr@...>
Topic: 35173 Message: 35194

Sorry, Yahoo Groups seems to be confused about superscripts, which makes expressing exponents rather difficult. So, we might try using:
10^x
y^x
10^0.6
10^-6
etc. etc.
73, Bruce Prior N7RR

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

First let's talk about the term <decibel> or plural <decibels>. That is a unit in the International System of Units (SI) which was named after Alexander Graham Bell, who not only developed the telephone, but he also made significant contributions to the hearing-impaired community. See http://en.wikipedia.org/wiki/Decibel http://en.wikipedia.org/wiki/Decibel. Although the title of the Wikipedia article capitalizes decibel, it should be written in lower case.

The root unit is the <bel>, with an SI symbol <B> (Notice the upper-case B for the symbol, which is typical of SI symbols which are named after a person. Other examples are V for volt, A for ampere, C for coulomb, etc. A decibel, with the SI symbol <dB> is 1/10 of a bel. (Note the lower-case <d> and the upper-case <B>.) So 30 decibels is the same value as 3 bels.

I find that bels are easier to grasp than decibels. The bel is used to compare the strength or power or intensity of some physical quantity with another standard. It is logarithmic. It is actually 10 to the power of x (10x), where x is the quantity expressed in bels. So, 50 decibels is the same as 5 bels or 105 or 100 000. A quantity of 50 decibels is 100 000 times stronger or more intense than some standard quantity. (Note that long integers or fractions in SI are separated by spaces or half-spaces rather than commas. That's because either the dot <.> or the comma <,> can be used as a decimal marker in SI. 144,390 kHz is not the well-known APRS frequency on the 2-meter band. It is the same as 144.390 kHz, which is well below the AM broadcast band.) To listen to 1200-baud digital bursts of APRS packets, tune your Baofeng UV-5RE transceiver to 144.390 MHz or 144 390 kHz, also written 144 390 kilohertz. You need a modem to translate the digital signal. Margaret K7MWP and I recently returned from a trip to Vancouver Island, where I was operating my APRS rig with my Canadian call sign VE7HR. See http://aprs.fi/#!mt=roadmap&z=15&call=a%2FVE7HR&timerange=345600&tail=345600 http://aprs.fi/#!mt=roadmap&z=15&call=a%2FVE7HR&timerange=345600&tail=345600 . Perhaps someone on this list knows of a computer mobile device application which will demodulate 1200-baud APRS packets using simple audio coupling with your Beofeng UV-5FE transceiver.

Lots of radio amateurs misuse the SI symbol dB by adding a suffix to it, like 6 dBd. Although you will see expressions like that frequently, even in ARRL publications, they are incorrect. "6 dBd" should read something like "6 dB gain compared to a half-wavelength dipole antenna in free space." Adding suffixes to SI symbols is not correct.

For more details about SI or the International System of Units, study http://en.wikipedia.org/wiki/International_System_of_Units http://en.wikipedia.org/wiki/International_System_of_Units . The National Institute of Standards and Technology, or NIST, is the designated SI authority in the USA. Normally the NIST website is an excellent source of information about SI, but NIST and its website is currently closed because of the US government shutdown. A similar entity in the United Kingdom is the National Physical Laboratory. See http://www.npl.co.uk/reference/measurement-units/si-conventions/ http://www.npl.co.uk/reference/measurement-units/si-conventions/ for an authoritative perspective on SI. The National Measurement Institute does the same job in Australia. See http://www.measurement.gov.au/measurementsystem/Pages/HowAustraliasMeasurementSystemWorks.aspx http://www.measurement.gov.au/measurementsystem/Pages/HowAustraliasMeasurementSystemWorks.aspx for details.

So, what does "6 dB" or "-60 dB" mean? To answer that, pull out your scientific calculator. It might have a function called <10x> or <yx>. First convert the decibels to bels:
6 dB = 0.6 B and
-60 dB = -6 B
Now plug those values into your scientific calculator.
100.6 = 3.98
10-6 = 0.000 001

I bought a used uv5 for $25.00. It came with an extra battery, hand speaker mic, earbud mic, and a 12 volt power cord. It also couldn't hear my local repeater without using the mon button. I could hear china girl talking and fm radio stations.I was going to try to reset it using the info found at the Miklor site below, but decided to buy another one from Amazon for $31.00. Got that one working via CHIRP, then read the other radio and copied the good info into the bad radio. Now they both work just fine. 2 radios and extras for $56.00, not bad.

Yes, use of the caret is more universally explicit exponentiation, but the superscripts you posted were perfectly legible here in both Mozilla browser and Icedove email clients. The problem isn't Yahoo! groups but rather the user's inadequate font set.

Excellent OP BTW, thank you.

It''s cheaper to get the ham ticket.

- It's a one time fee ($0 if you test through a Laurel VEC)
- The radios are cheaper ($31)
- The license term is twice as long and indefinitely renewable for free*.

*unless you buy yourself a vanity CS, then you must pay the current rate when renewing.

copy n paste from the title page, cause I am sick of all the FCC will not allow etc.. 5. PLEASE also no discussion of LEGALITY of this radio for FRS, GMRS, etc operation and FCC part acceptance for part 95 etc. This radio is NOT approved for that use, but it is USA legal for commercial. amateur band and any use as a receiver. Old, very stale topic.

I think everyone should know this. why does this radio interest me? well because of its GMRS use WROL < Google that..

please talk radio not law.thank you

The FCC will not allow you to use a UV-5R on GMRS.

Graph came from Google Earth. You simply use the ruler to draw a line and save it. Then you can right-click the line and click "Show Elevation Profile". It's reasonably accurate.

Rats on the roof antenna - what antenna are you using?

And you didn't say but I assume other repeaters are working fine? NOAA comes in loud and clear?

I also don't see a height mentioned for that repeater.

Anybody know exactly where the repeater is? I used KU4B's home address. I do see an antenna tower in Short Mountain at 39 52 00.94N and 85 58 32.87W

If that's the repeater then this is a jolly good place for a repeater for the mountain folk and this is the elevation profile.

Again might explain why he can hear you but you can't hear him. Unless they've got the radiating pattern at a very low angle which I doubt most of their power is over your head.

Could be their target audience is the mountain folk.

In this case I wouldn't' expect your receive to get a whole lot better better until you start climbing the mountain as you'd be decreasing your angle to it for quite a while.

That's awesome data, Mike! Where did you get the graph? I can see where that info would come in handy all the time.

The unfortunate part is that I DO have an antenna on my roof. I guess I need to add some additional height to it.

Thanks again for the info,

Evans Martin

KK4TYW - Nashville, TN USA

On Fri, Oct 11, 2013 at 4:02 PM, Michael Black <mdblack98@...> wrote:

I think you may just be experiencing a difference in antenna radiation pattern.

If I got the addresses right for from you to KU4B this is the elevation profile between you.

So you aren't line of sight. And he's about 14 miles away.

You're lucky you can key his repeater at all. His antenna may not radiate well back to you with that +30 foot land peak a couple of miles from you. And I don't see a listing of what antenna he's running.

I'll bet if you drive a few miles SE you can hear it just fine. Or get an antenna on your roof and you'll probably be OK too.

I'm having trouble with one of the repeaters near my home in Nashville, TN, 145.490. People can hear me but I can't hear them. They tell me that they suspect that I have some kind of receive squelch on but I haven't been able to find it. The Tone Mode column in CHIRP is set to (None). Picture attached Line 17.

Can anyone suggest what I should try next?

Thanks,

Evans Martin

I calibrated with an Elecraft XG3 which spits out -107dBm, -73dBm, -33dBm,
and 0dBmj and an MFJ-762 step attenuator.

As per http://en.wikipedia.org/wiki/DBm the S Meter Lite program calibrates
based on S9=0dB and I used -73dBm as 0 as the calibration (S Meter only runs
from -18dB to 12dB so can't use -73dBm). S Meter then spits out "SyndB"
which is what I record so I really don't want to hide the recorded values.

Perhaps I should just call it "SyndB" or "dBs9" or such and explain what
that is but they are just a straight dB offset from -73dBm.

Is there an official unit of measurement for S9=0dB?

Regarding the roof antenna; what quality of coax are you using and how long is it? It is possible that the losses in the coax counter any gain of the antenna.

Jim,

Yes actually. The cost is more to do with politics, regulations, and labor practices, along with size of market and demand. But that's besides the point and way off topic.

The issue I have with the headset, is the sound quality. The audio quality coming out of the hand set's speaker, sound more natural, well as natural as a voice that's electronically converted to radiation, transmitted several miles, and converted back to pressure waves can. Where as the ear piece seems to be missing something, it just doesn't sound as clear.

It sounded muddled and hollow.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote:

Doug,

Thanks. While the main goal is find out about the ear-pads, I'm not overly impressed by the head set that came with it.

-C

The radio can be purchased from Amazon.com delivered to your door for $36. Let's say it costs $4 to get it to you. Then that leaves $32 for the radio itself. Most of that cost goes into the 4 major components (radio, antenna, battery and battery charger). And don't forget some is going to Amazon and the Seller. Did you really expect to be impressed by the headset?

Thanks Gord…I knew that standard….my question was about units. It's not S Units.

For now I'm just calling it dBS9 since it is dB and relative to S9 and explaining it.

Or is there a better unit of measurement that is out there…I can't seem to find anything for this case to notate the raw values?

Should say this is the comment I've added for it.

VHF dBs9 measurements are relative to S9=0dB=50uV due to Smeter Lite limitations and you can subtract 73dB to get dbM values

I agree mine sounds poor as well. I think that is the best it is going to get. I think if you want better you need to buy a different and better one.

Jim,

Yes actually. The cost is more to do with politics, regulations, and labor practices, along with size of market and demand. But that's besides the point and way off topic.

The issue I have with the headset, is the sound quality. The audio quality coming out of the hand set's speaker, sound more natural, well as natural as a voice that's electronically converted to radiation, transmitted several miles, and converted back to pressure waves can. Where as the ear piece seems to be missing something, it just doesn't sound as clear.

It sounded muddled and hollow.

Doug,

Thanks. While the main goal is find out about the ear-pads, I'm not overly impressed by the head set that came with it.

-C

The radio can be purchased from Amazon.com delivered to your door for $36. Let's say it costs $4 to get it to you. Then that leaves $32 for the radio itself. Most of that cost goes into the 4 major components (radio, antenna, battery and battery charger). And don't forget some is going to Amazon and the Seller. Did you really expect to be impressed by the headset?

Hi All

dB is a relative term, when using it all it show is a change not an absolute value.

The unit must be qualified:

In radio 0dBm is 1mw into 50 ohms, 0dBw is one watt into 50 ohms (1000mw), 0dBm into 600 ohms is audio talk.

By using dBm, you are using an industry standard, this is an absolute value, here and around the world.

Anything else is relative to the reference and that’s why there is dBi/dBd when talking about antennas gains.

S meters suffer from amplifier gain error and rectification non linearity’s.

I use a calibrated spectrum analyzer but it will suffer errors if not working into a 50 ohm load or antenna and then the gain of the receiving antenna must be factored in or the readings will be in error.

I have calibrated RF chambers and satellite flight antenna systems, and I use a RF Chamber every day at work, and the signal strength at any give location can change depending on terrain and proximity to objects.

The only way to test an antenna is in a RF Chamber where there is a reflection free environment.

And one of the favorite test questions on cert exams is 3db (half power frequency curve response points) is Power utilizing I and E components.

The half power variable for a E component would be 6DB

Logarithmic visually displays during spectral analysis was always much easier to view across the selected bandwidth than linear visualizations.

We seldom did calibrations utilizing linear modes in a test calibration standards lab, Linear analysis was only used to look at waveforms in composite signals while almost all other measurements used DB.

I would disagree that the RF chamber is the “only” way. It most certainly doesn’t test point-to-point propagation (though one could theoretically calculate that from the pattern assuming a pattern was being measured). The RF chamber will control variables better than what I can do in my test. I simply attempted to repeat the way I held the radio for my test. I am publishing all the data so one can take as big a grain of salt as one wants with the results.

And you’re correct about S meters being bad…except when calibrated to a dBm standard like I did in a separate program which bypasses the radio S meter values. And the S meter’s response on multiband is inconsistent which is why I show ~dBs9 on my data since I can’t calibrate the UHF side with the XG3. Nonetheless, the relative values are still useful if not 100% accurate to scale.

You can see the non-linearity of my ICOM S meter in this calibration plot…it’s really bad at the low end. I tried calibrating the radio and gave up so S Meter Lite allowed me to calibrate and do a much better job.

Obviously not everyone knows this information...myself being one of them.

While /*ignorantia juris non excusat */is not an absolute, it certainly would apply here given the access to information that exists.

Having just joined this group to learn more about the UV-5R, I see new members joining every week...so it is to be expected that these questions will continue to be asked and answered. That is the function of such groups.

In following the threads and comment here and elsewhere, I think I have educated myself rather significantly on what is and is not allowed by FCC parts 80, 90, 95, and 97. Until now the only part that I really knew anything about was part 97.

So, if it is a very old, stale topic to you, to many others it is useful new information. Just skip reading these messages...I do that on many topics I see here, such as using these radios as repeaters...not interested, so I skip them.

35232. Antenna Testing

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-12 16:20:34 UTC
From: Michael Black
Topic: 35155 Message: 35232
Attachments: 1 described; binary payloads are missing from this source WARC

I've attached a PDF of the antenna testing I've done which now includes both VHF and UHF. Looks like the list now accepts attachments.

Thanks for all the comments. Any more comments are more than welcome.

Here's what I'll call the winners:

Overall winner: Harvest RH-660S -- but it's really awkward to use and would strain the connector on the radio unless you're not moving the radio. So as a semi-base station setup it's the definite winner.

Extendable winner: Smiley 270A – given that ~40" extendables are a pain to use the Smiley is 21" – but you do have to collapse the top 2 sections for UHF performance.

Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart

Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The Baofeng stock antenna (A-5R Logo) you get from most dealer's is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15" category and are only beat by the really long (~40") extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.

Red is extendables, blue is mag mounts, black is fixed length

There are a number of moderators that typically take a hands-off approach.

The easiest course of action, and one that completely complies with the rules and spirit of this group, is to just ignore questions or statements about use of the radio that is illegal in one's jurisdiction. If the person does not get their question answered and asks why, you can point them to the group's charter.

I believe the group moderators have done a fantastic job with a very difficult topic. Most of the time the responses are held to one or two answers and if it gets out of hand a request to move on.
I do feel we can ask for no more than that with such a large divers and international group

Once again I must say thank you to a fantastic group of moderators handling a very difficult topic.

Arrghhhh….one typo in spreadsheet giving RH660S a positive 10dB instead of negative 10dB in UHF. RH660S is still the overall winner.

So here’s version 1.1.

35240. RE: replacement ear pad for handsfree unit

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-12 18:07:10 UTC
From: <wv8a@...>
Topic: 35159 Message: 35240

Replacement foam pads for iPod-style earbuds are available anywhere that carries audio accessories (RadioShack, BestBuy etc.); these fit ok on the BaoFeng earbud. The foam pad, for me, adds nothing in the way of better fit, acoustic coupling or comfort, so I'm fine with a non-cushioned earbud for as little as I use it. To hand-hold the HT for transmitting but use an earplug, earbud or stereo headphones to listen, the cable end needs to have a tiny 2.5mm stereo plug, so an adaptor or a DIY plug replacement is needed. The 3.5mm jack on the radio is for the microphone and PTT lines.

There are several towers on Short Mountain in Tenn.. The most used
repeater is the 146.910 that is the Short Mountain Repeater Club,
145.490, 444.650 & 444.825. There maybe others I'm not aware of.

From Short Mountain Repeater Club's qrz page.
*Short Mountain Repeater Club, Inc.*was established on May 14,1978. The
repeater site is located in Woodbury, Tennessee approximately 65 miles
SSE of Nashville, Tennessee on top of Short Mountain at an elevation of
2,385 feet. We are an ARRL affiliated club.

Subject: Re: [baofeng_uv5r] Re: New antenna

The spectrum Analyzer is generally what we used too, as a matter of fact I helped design this ICP because we were using complicated Zo Plane setups that took a long time to setup for testing.

We are also talking about high end analyzers (generally HP) that run into the 100 of thousands each.

A network analyzer can be used, we used on our LNA parametric amplifiers, but the weak area again is the detector section which can cause an error that must be factored in.

The great thing about the RF screen rooms is you can seal the door and go to sleep while doing testing on waveguide sections and attenuators

Subject: Re: [baofeng_uv5r] Re: New antenna

Hi All

dB is a relative term, when using it all it show is a change not an absolute value.

The unit must be qualified:

In radio 0dBm is 1mw into 50 ohms, 0dBw is one watt into 50 ohms (1000mw), 0dBm into 600 ohms is audio talk.

By using dBm, you are using an industry standard, this is an absolute value, here and around the world.

Anything else is relative to the reference and that's why there is dBi/dBd when talking about antennas gains.

S meters suffer from amplifier gain error and rectification non linearity's.

I use a calibrated spectrum analyzer but it will suffer errors if not working into a 50 ohm load or antenna and then the gain of the receiving antenna must be factored in or the readings will be in error.

I have calibrated RF chambers and satellite flight antenna systems, and I use a RF Chamber every day at work, and the signal strength at any give location can change depending on terrain and proximity to objects.

The only way to test an antenna is in a RF Chamber where there is a reflection free environment.

Subject: Re: [baofeng_uv5r] Re: New antenna

And one of the favorite test questions on cert exams is 3db (half power frequency curve response points) is Power utilizing I and E components.

The half power variable for a E component would be 6DB

Logarithmic visually displays during spectral analysis was always much easier to view across the selected bandwidth than linear visualizations.

We seldom did calibrations utilizing linear modes in a test calibration standards lab, Linear analysis was only used to look at waveforms in composite signals while almost all other measurements used DB.

Hi Jim

How would they know ?? each oscillator has phase noise, a kind of digital signature and it cannot be changed just like finger prints.

Do what you want but keep I mind the fine is $10,000.00 and 6 months in jail or both for each instance.

Transmit 2 times and there goes the collage fund for you child, 6 times and they have your house…Think about it.

Mike, I see that besides you, Mr Pryor has also had good luck with the Harvest RH660 antenna.
I am wondering where did you buy this particular model and if we know if there are fakes around as well. ????
A search on line revealed that the antenna with a SMAF is readily available on ebay form a seller for about $20 delivered. There is also a seller on alibaba selling them for $15 delivered
http://www.aliexpress.com/store/product/Harvest-RH-660S-telescopic-antenna-for-UV-5R-walkie-talkie-SMA-Fmale/714302_718086252.html

I am wondering if any of these sources will supply a well performing version???

My thinking is to use it at home instead of the ducky

WRT the Baofeng antennas, could you provide photos of which model is which?? I have seen 2 different ones. One I got from threeoldcrows and another my friend got from an amazon source. I did post pictures of the two radios/antennas side by side.

WRT the Smiley 270a, they have 2 different SMAF connectors. is yours the one with the recessed teflon face or flush face??? My Smiley does not seem to do much for me compared to the Baofeng ducky.....

Tony

On Saturday, October 12, 2013 12:22 PM, Michael Black <mdblack98@...> wrote:

I've attached a PDF of the antenna testing I've done which now includes both VHF and UHF. Looks like the list now accepts attachments.
Thanks for all the comments. Any more comments are more than welcome.

Here's what I'll call the winners:

Overall winner: Harvest RH-660S -- but it's really awkward to use and would strain the connector on the radio unless you're not moving the radio. So as a semi-base station setup it's the definite winner.
Extendable winner: Smiley 270A – given that ~40" extendables are a pain to use the Smiley is 21" – but you do have to collapse the top 2 sections for UHF performance.
Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart
Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The Baofeng stock antenna (A-5R Logo) you get from most dealer's is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15" category and are only beat by the really long (~40") extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.
Red is extendables, blue is mag mounts, black is fixed length

Hello, I have a new Baofeng BF-F8+ and cannot be sure which is the correct software to program this radio. There are so many variants of the UV-5R line and It's confusing. I don't want to "brick" the radio.

The BF-F8+ is a UV-5R knock-off, minus the band button. If anyone knows which software is the correct one for this, Please e-mail me at foamhand@yahoo.com mailto:foamhand@yahoo.com

Previously had the programming cable working fine.

Plugged it to change some frequencies around, the radio goes in to transmit and I get a USB device error.

Removed the driver, reinstalled it as per http://www.miklor.com/COM/UV_Drivers.php disabled driver downloads from Windows update, power cycled everything, same thing radio goes into transmit as soon as the programming cable is connected and I get a USB COM20 device with the yellow !

This is rather annoying as the radio is used as a link radio for my EchoIRLP node, and I need to change the frequency it's on.

Any one got ideas on how to get this driver working on Windows 7 x64.

As a work around I manually reprogrammed the radio, much easier than I thought. Not sure why so many people are afraid of manually programming these, I was told they are hard to program and the only way to go was to use CHIRP and a programming cable.

Thanks Bruce. That's the first explanation I've heard that
actually manages to make sense! Most of them get bogged down in
algebra.

> (Note that long integers or fractions in SI
> are separated by spaces or half-spaces rather than commas. That's because either the dot
<.> or the
> comma <,> can be used as a decimal marker in SI.

I must take issue with you here. While SI notation does indeed
use that system, the general public doesn't.

> 144,390 kHz is not the well-known APRS
> frequency on the 2-meter band. It is the
> same as 144.390 kHz,

Not in English. It is convention in the UK and US to write a
thousand as 1,000 and one and a half as 1.5 (and in Europe the
other way round, though which convention is used will be obvious).

(Actually, it was convention in the UK to put the decimal point
half way up, but this fell out of use as it's difficult to type
and impossible to produce on a PC keyboard).

> Lots of radio amateurs misuse the SI symbol dB by adding a

But perfectly correct in general use - especially with dB! As
well ad dBd and dBi (a daft concept IMO), we have dBm, dbV, dbu,
and a host of others. They might be "incorrect" according to the
written standard, but to eliminate them would be inconvenient at
best.

It is easy to keypad program the UV-5R. I learned how to do it with Ian's "eyes-free" guide. If the UV-5R can be programmed with your eyes closed, how hard can it be?

> Not sure why so many people are afraid of manually programming these,
>
Part of the problem was that many of the early manual programming guides left out vital prerequisites that the new user would not have readily known. Things like "all channel programming must be done from the top VFO" and "the target channel must be empty". This led to owners struggling with their radios for many hours, days and sometimes even weeks without any success at programming their new radios.

Another part of the problem seems to be that many hams are stuck on the use of an RX frequency, a (+) or (-) shift direction and an offset amount for programming channels. They seem to be tripped up by the UV-5R using an RX/TX frequency pair instead.

These things plus the fact that the "User's Manual" that came with the UV-5R did not even attempt to show you how to program the it, led to the "myth" that the UV-5R is difficult to program from the keypad.

> I was told they are hard to program and the only way to go was to use
> CHIRP and a programming cable.
>
There are many settings and options that can only be changed by using programming software. Depending on how you use your radio, some of these settings and options could be critical to its operation. So owning (or at least having access to) a programming cable and software could be very important.

Although I am biased towards CHIRP, there is noting wrong with using any of the other software programming alternatives for the UV-5R.

35270. MURS vs GMRS

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-13 14:11:28 UTC
From: <plaisaeb@...>
Topic: 35270 Message: 35270

Before asking this question, I checked out whether there were any Yahoo Groups for GMRS and MURS users...there are, but there has been no activity on either site in 7 days, and membership is very low.

So...since this group seems to have broad experience and knowledge in such topics, I was wondering what would be the recommendations/preferences for the following communications scenarios (NOT using the UV-5R...we have beat that horse enough):

1. between family vehicles while traveling (mag mounts would be used)
2. between family residences in a neighborhood (preferably using the same mag mounts indoors)

I would appreciate comments from people who have actually set up either MURS or GMRS systems.

Note: the suggestion has been made to get a Tech license and I would agree that would offer the best options, but these family members would never go for that effort :)

On Saturday, October 12, 2013 10:31 PM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

Hello Tony,

I sent Mike both antennas (Harvest 660 and 770) they average around $20 each with the 770 being slightly more towards $30 at some places. This was the antenna I got a few months back and during testing on a hill top in a State Park I was able to pickup signals from Hawaii (Big Island) from S Cali. That was really amazing, they could not hear me (I tried) and it seems they were around Mauna Kea possibly from HP Astronomy base station located there. Anyway, switching antennas only that Harvest version could pick them up and only when the antenna was placed at a certain angle (RF slice) I knew it would do well as I played with them, I was surprised though the 660 was much better than the 770. The downside is they are metal telescopics and possibly heavy on the uv5 with the 1800 battery. With the larger battery the weight is more distributed and not as bad.

I think I paid $20 or close to that amount for them, the 770's are much beefier with a hologram gold seal on them. The 660's have a silver seal on them. They are made in Taiwan and the Chinese writing is Traditional Chinese which is different from Simplified PRC versions (which would be fakes) Packaging is in Yellow bags.

You will find differences in prices from $5-10 but anything much lower than the average price I would be careful.

ALSO NOTE to all!!

I enquired and ordered some Export CB radio items from AliBaba and never received anything, this site is full of scams and some legit companies must either have inside employees giving out Emails for quotes and doing the scamming or their accounts are hacked. Somehow, someone using a legit inquiry and company webpage was able to intercept my request.

Subject: Re: [baofeng_uv5r] Antenna Testing

Mike,
I see that besides you, Mr Pryor has also had good luck with the Harvest RH660 antenna.

I am wondering where did you buy this particular model and if we know if there are fakes around as well. ????
A search on line revealed that the antenna with a SMAF is readily available on ebay form a seller for about $20 delivered. There is also a seller on alibaba selling them for $15 delivered
http://www.aliexpress.com/store/product/Harvest-RH-660S-telescopic-antenna-for-UV-5R-walkie-talkie-SMA-Fmale/714302_718086252.html

I am wondering if any of these sources will supply a well performing version???

My thinking is to use it at home instead of the ducky

WRT the Baofeng antennas, could you provide photos of which model is which?? I have seen 2 different ones. One I got from threeoldcrows and another my friend got from an amazon source. I did post pictures of the two radios/antennas side by side.

WRT the Smiley 270a, they have 2 different SMAF connectors. is yours the one with the recessed teflon face or flush face???
My Smiley does not seem to do much for me compared to the Baofeng ducky.....

Tony

I've attached a PDF of the antenna testing I've done which now includes both VHF and UHF. Looks like the list now accepts attachments.
Thanks for all the comments. Any more comments are more than welcome.

Here's what I'll call the winners:

Overall winner: Harvest RH-660S -- but it's really awkward to use and would strain the connector on the radio unless you're not moving the radio. So as a semi-base station setup it's the definite winner.
Extendable winner: Smiley 270A – given that ~40" extendables are a pain to use the Smiley is 21" – but you do have to collapse the top 2 sections for UHF performance.
Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart
Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The

Baofeng stock antenna (A-5R Logo) you get from most dealer’s is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15” category and are only beat by the really long (~40”) extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.
Red is extendables, blue is mag mounts, black is fixed length

MURS doenst require paying for a license like GMRS. OTH, MURS rigs
are more expensive than the bubble pack GMRS rigs one can find. GMRS
licenses do allow GMRS operation by a broad spectrum of the actual
licensees's family members.

MURS with external mag mounts would give you the best range.
Use the 151 freqs (narrow mode) because the 154 freqs are
full of walmarts. You wouldn't want to use the UV-5R for this use
anyway, the front end would not handle the incoming RF with the
external antenna. If you search the message archives at
MURS and MURS-Open (if you still can) you should find
suitable radios for MURS use with decent front ends.

Just a quick note to thank everyone and let you know that the problem was with the radio. The new one came Friday and it was night and day difference. Side by side, a strong signal that breaks the squelch on the new radio, wouldn't even overcome minimum squelch with the old radio. Listening to signals while holding the monitor button on the new radio, can't even be heard on the old one. I'll be packing it up and sending it back.
---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote:

When you get the new rig, don't forget to try swapping antennas. It is more likely that you got a bad antenna than a bad radio. If that turns out to be the problem, part of the fun of owning an HT is buying it 3rd party antennas for it.

Jim KC9HI

On Wed, Oct 9, 2013 at 10:06 PM, <llenn@... mailto:llenn@...> wrote:
OK, thanks for the replies. Very helpful group!

After digging in a little deeper, I found a closer NOAA station and when unsquelched, I was able to hear the signal. It was very weak, but I was encouraged that the unit was capable of receiving SOMETHING...I moved position and found spots where the reception was OK enough to hear the reports clearly. This is from a station putting out 500 watts only 15 miles away! I really suspect that the front end on this radio may be defective. I played around and was able to key a local repeater, but again, the reception was terrible. I can key the repeater with 1 watt, yet the station ID is barely readable. The HT seems very sensitive to my position and the orientation of the antenna. Too much so, imo.

Rather than stress about whether I got a bad one, I just ordered another from Amazon which will be here Friday. I'll compare them both and be certain that I didn't get a defective unit.

Thanks for the help. I'll take advantage of my time with this one to learn the ropes. The programming is definitely quirky, but I kind of like it...

---In baofeng_uv5r@yahoogroups.com mailto:baofeng_uv5r@yahoogroups.com, <xaunloc@...>
wrote:

Try this before giving up:

1. Set the frequency to the NOAA frequency for your area and turn up the volume. Do you get audio?
2. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?
3. Plug in the headset that came with the radio. Do you get audio?
4. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?

If you get audio at step 1, everything is working

If you get audio at step 2, you may have a receive CTCSS Tone or receive DCS code set (check menus 10 & 11), both should be OFF
If you get audio at step 2 AND menus 10 & 11 are both set to OFF, then you probably have a corrupted memory. See http://www.miklor.com/uv5r/UV5R-Recovery.php
http://www.miklor.com/uv5r/UV5R-Recovery.php

If you get audio at step 3, the problem is either the internal speaker or (more likely) the mic/earphone plug on the radio. Since the radio is new, return it as defective.

If you get audio at step 4, you have both problems 2 & 3 above.

If you still have not gotten any audio, return the radio as defective.

Subject: [baofeng_uv5r] Is my UV-5RA broken?

I just received my UV-5RA and can't receive any local repeaters. I don't have another radio to test simplex. Bottom line, I haven't heard a word come out of the speaker (except for the voice menu). I've unsquelched and hear static, but not even a faint signal on any frequency. I can't key repeaters (or if I am, I can't hear it). I know these radios are notorious for being difficult to program, but I'm pretty certain I should have heard something. Even NOAA stations won't come in. Is there something I'm doing wrong or this bad out of the box?

The BF-F8+ is a UV-5R knock-off, minus the band button. If anyone knows which software is the correct one for this, Please e-mail me at foamhardly@...

My BF-F8 is a Baofeng UV-5R variant, not a "knock off" counterfeit. I very successfully use the chirp software on a Debian Linux laptop, which makes programming a breeze.

You can read this post in the Yahoo! baofeng_uv5r discussion group, as I'm not being paid enough to be your private email consultant.

Oops, meant to include that. Yes I did switch antennas and it made no difference. Before the new radio came, I tried my mag mount 2m antenna which made no difference so I suspected that this wasn't an antenna issue.

Just a quick note to thank everyone and let you know that the problem was with the radio. The new one came Friday and it was night and day difference. Side by side, a strong signal that breaks the squelch on the new radio, wouldn't even overcome minimum squelch with the old radio. Listening to signals while holding the monitor button on the new radio, can't even be heard on the old one. I'll be packing it up and sending it back.

On Wed, Oct 9, 2013 at 10:06 PM, <llenn@... mailto:llenn@...> wrote:
OK, thanks for the replies. Very helpful group!

After digging in a little deeper, I found a closer NOAA station and when unsquelched, I was able to hear the signal. It was very weak, but I was encouraged that the unit was capable of receiving SOMETHING...I moved position and found spots where the reception was OK enough to hear the reports clearly. This is from a station putting out 500 watts only 15 miles away! I really suspect that the front end on this radio may be defective. I played around and was able to key a local repeater, but again, the reception was terrible. I can key the repeater with 1 watt, yet the station ID is barely readable. The HT seems very sensitive to my position and the orientation of the antenna. Too much so, imo.

Rather than stress about whether I got a bad one, I just ordered another from Amazon which will be here Friday. I'll compare them both and be certain that I didn't get a defective unit.

Thanks for the help. I'll take advantage of my time with this one to learn the ropes. The programming is definitely quirky, but I kind of like it...

mailto:xaunloc@... wrote:

Try this before giving up:

1. Set the frequency to the NOAA frequency for your area and turn up the volume. Do you get audio?
2. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?
3. Plug in the headset that came with the radio. Do you get audio?
4. Press & hold the MONITOR button on the side of the radio (the button below the Push To Talk button). Do you get audio?

If you get audio at step 1, everything is working

If you get audio at step 2, you may have a receive CTCSS Tone or receive DCS code set (check menus 10 & 11), both should be OFF
If you get audio at step 2 AND menus 10 & 11 are both set to OFF, then you probably have a corrupted memory. See http://www.miklor.com/uv5r/UV5R-Recovery.php
http://www.miklor.com/uv5r/UV5R-Recovery.php

If you get audio at step 3, the problem is either the internal speaker or (more likely) the mic/earphone plug on the radio. Since the radio is new, return it as defective.

If you get audio at step 4, you have both problems 2 & 3 above.

If you still have not gotten any audio, return the radio as defective.

You can find the Baofeng antennas on their website. I probably should include a reference or picture in the PDF to distinguish those since they aren't marked and a lot of people may want to know what they have.

http://www.baofengradio.com/en/product.asp?BigClassName=Accessories <http://www.baofengradio.com/en/product.asp?BigClassName=Accessories&Smallclassname=Antenna>
&Smallclassname=Antenna

What most people refer to as the "stock" antenna is the UV-5R Logo though the term "stock" is technically incorrect. It's what most people get and I do believe the default if the dealer doesn't ask for something different.

That's the one of the left below…the A-V85 is the one on the right. Both have white-on-black printing around the jack with FM/138-174/400-480MHz printed on it.

I know threeoldcrows only ships with the A-V85…don't know about anybody else.

Mike, I see that besides you, Mr Pryor has also had good luck with the Harvest RH660 antenna.
I am wondering where did you buy this particular model and if we know if there are fakes around as well. ????
A search on line revealed that the antenna with a SMAF is readily available on ebay form a seller for about $20 delivered. There is also a seller on alibaba selling them for $15 delivered
http://www.aliexpress.com/store/product/Harvest-RH-660S-telescopic-antenna-for-UV-5R-walkie-talkie-SMA-Fmale/714302_718086252.html

I am wondering if any of these sources will supply a well performing version???

My thinking is to use it at home instead of the ducky

WRT the Baofeng antennas, could you provide photos of which model is which?? I have seen 2 different ones. One I got from threeoldcrows and another my friend got from an amazon source. I did post pictures of the two radios/antennas side by side.

WRT the Smiley 270a, they have 2 different SMAF connectors. is yours the one with the recessed teflon face or flush face??? My Smiley does not seem to do much for me compared to the Baofeng ducky.....

Tony

On Saturday, October 12, 2013 12:22 PM, Michael Black <mdblack98@...> wrote:

I've attached a PDF of the antenna testing I've done which now includes both VHF and UHF. Looks like the list now accepts attachments.

Thanks for all the comments. Any more comments are more than welcome.

Here's what I'll call the winners:

Overall winner: Harvest RH-660S -- but it's really awkward to use and would strain the connector on the radio unless you're not moving the radio. So as a semi-base station setup it's the definite winner.

Extendable winner: Smiley 270A – given that ~40" extendables are a pain to use the Smiley is 21" – but you do have to collapse the top 2 sections for UHF performance.

Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart

Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The Baofeng stock antenna (A-5R Logo) you get from most dealer's is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15" category and are only beat by the really long (~40") extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.

Red is extendables, blue is mag mounts, black is fixed length

From: Michael Black
Topic: 35155 Message: 35288

Looks physically the same as the one I tested. But the antenna base and bottom 3/8” section on the one I have is flat black and is semigloss where the holographic sticker and blue lettering is.

That’s the opposite of the one on your eBay link.

Plus the blue lettering is different:

The one I have says in 3 lines:

RH660S (instead of RH-660S)

144/430 MHz & WIDE BAND

RECEIVING COVERAGE

Notably different than the 4-line printing on the eBay antenna.

I also see a silver Harvest holograph on mine but not the eBay one.

I also see the round sticker printing is towards the outside instead of the inside.

I also see the round sticker on mine has the trademark symbol outside the “CO” in COMMUNICATION instead of outside the “F” in “OF”.

I also see the washer on the SMA connector fills up the base of mine and the eBay one looks like it’s smaller.

So I’d say either I have two fake ones or the EBay one is a fake or Harvest has changed their manufacturing and labeling quite a bit since Richard bought these antennas.

Also, the Harvest RH770 I have has the exact same lettering, a gold Harvest holograph, and the same flat black sections as my RH660S, and the rest of the RH770 is stainless steel

If I knew how or who to contact at Harvest I’d ask for signs of fake antennas. Can’t seem to find a corporate site though.

On Saturday, October 12, 2013 10:31 PM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

Hello Tony,

I sent Mike both antennas (Harvest 660 and 770) they average around $20 each with the 770 being slightly more towards $30 at some places. This was the antenna I got a few months back and during testing on a hill top in a State Park I was able to pickup signals from Hawaii (Big Island) from S Cali. That was really amazing, they could not hear me (I tried) and it seems they were around Mauna Kea possibly from HP Astronomy base station located there. Anyway, switching antennas only that Harvest version could pick them up and only when the antenna was placed at a certain angle (RF slice) I knew it would do well as I played with them, I was surprised though the 660 was much better than the 770. The downside is they are metal telescopics and possibly heavy on the uv5 with the 1800 battery. With the larger battery the weight is more distributed and not as bad.

I think I paid $20 or close to that amount for them, the 770's are much beefier with a hologram gold seal on them. The 660's have a silver seal on them. They are made in Taiwan and the Chinese writing is Traditional Chinese which is different from Simplified PRC versions (which would be fakes) Packaging is in Yellow bags.

You will find differences in prices from $5-10 but anything much lower than the average price I would be careful.

ALSO NOTE to all!!

I enquired and ordered some Export CB radio items from AliBaba and never received anything, this site is full of scams and some legit companies must either have inside employees giving out Emails for quotes and doing the scamming or their accounts are hacked. Somehow, someone using a legit inquiry and company webpage was able to intercept my request.

Mike

FYI, WRT 3 old Crows.....my radio from Kurt came with the antenna pictured on the left. My friends antenna, from Amazon, was similar to the one on the right.....

On Sunday, October 13, 2013 2:24 PM, Michael Black <mdblack98@...> wrote:

You can find the Baofeng antennas on their website. I probably should include a reference or picture in the PDF to distinguish those since they aren't marked and a lot of people may want to know what they have.

http://www.baofengradio.com/en/product.asp?BigClassName=Accessories <http://www.baofengradio.com/en/product.asp?BigClassName=Accessories&Smallclassname=Antenna>
&Smallclassname=Antenna

What most people refer to as the "stock" antenna is the UV-5R Logo though the term "stock" is technically incorrect. It's what most people get and I do believe the default if the dealer doesn't ask for something different.

That's the one of the left below…the A-V85 is the one on the right. Both have white-on-black printing around the jack with FM/138-174/400-480MHz printed on it.

I know threeoldcrows only ships with the A-V85…don't know about anybody else.

Subject: Re: [baofeng_uv5r] Antenna Testing

Mike, I see that besides you, Mr Pryor has also had good luck with the Harvest RH660 antenna.
I am wondering where did you buy this particular model and if we know if there are fakes around as well. ????
A search on line revealed that the antenna with a SMAF is readily available on ebay form a seller for about $20 delivered. There is also a seller on alibaba selling them for $15 delivered

http://www.aliexpress.com/store/product/Harvest-RH-660S-telescopic-antenna-for-UV-5R-walkie-talkie-SMA-Fmale/714302_718086252.html

I am wondering if any of these sources will supply a well performing version???

My thinking is to use it at home instead of the ducky

WRT the Baofeng antennas, could you provide photos of which model is which?? I have seen 2 different ones. One I got from threeoldcrows and another my friend got from an amazon source. I did post pictures of the two radios/antennas side by side.

WRT the Smiley 270a, they have 2 different SMAF connectors. is yours the one with the recessed teflon face or flush face??? My Smiley does not seem to do much for me compared to the Baofeng ducky.....

Tony

On Saturday, October 12, 2013 12:22 PM, Michael Black <mdblack98@yahoo.com> wrote:

I've attached a PDF of the antenna testing I've done which now includes both VHF and UHF. Looks like the list now accepts attachments.

Thanks for all the comments. Any more comments are more than welcome.

Here's what I'll call the winners:

Overall winner: Harvest RH-660S -- but it's really awkward to use and would strain the connector on the radio unless you're not moving the radio. So as a semi-base station setup it's the definite winner.

Extendable winner: Smiley 270A – given that ~40" extendables are a pain to use the Smiley is 21" – but you do have to collapse the top 2 sections for UHF performance.

Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart

Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The Baofeng stock antenna (A-5R Logo) you get from most dealer's is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15" category and are only beat by the really long (~40") extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.

Red is extendables, blue is mag mounts, black is fixed length

35290. RE: [baofeng_uv5r] Antenna Testing

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-13 19:26:08 UTC
From: Michael Black
Topic: 35155 Message: 35290

I'm not in the mood to buy a $40 antenna. So if you want to ship your antennas to me I'll test it alongside the others to see where it sits.

I wouldn't expect a triband like the RH951S to behave any better than any other 15" antenna.

And since the UT-108UV is 20" long and looks a whole lot like the UT-72-BNC at 21" I wouldn't expect much difference there at all.

The small increase they show in dBi won't make much difference. And the UT-108 uses RG-174 which has about twice the loss of RG-58.

If I use the the numbers from here and Belden's cable

http://www.arrg.us/pages/Loss-Calc.htm

RG-58 at 3M and 145MHz loses .493dB

RG-174 at 3M and 145MHz loses 1.107dB

At UHF frequencies it's about a 1dB loss to use RG-174 instead of RG-58.

So what looks like a UT-108 advantage would be reduced to a disadvantage by the time it gets to your radio with 2.15dBi reducing to 1.043dBi compared to 1.7dBi reducing to 1.207dBi for the UT-72 ..you see manufacturers don't tell you the gain through their cables. I think the materials in the antenna are probably the same.

From Nagoya's website:

UT-108

Frequency :142-148/430-450 MHz

Gain : 2.15 dBi

Height : 51 cm

Connector :BNC/SMA Male/SMA Female

Cable :RG-174 3m

UT-72

Frequency :140-170/430-480 MHz

Gain : 1.7/3.5 dBi

Height : 53 cm

Connector :BNC/SMA Male/SMA Female/PL-259

Cable :RG-58 3m

I think the main reason for the UT-72 is to get into the commercial band which it appears the UV-108 can't do.

Thanks for all the comments. Any more comments are more than welcome.

Thanks for both your excellent, informative work and its professional-quality presentation.

I was hoping to find results for the Diamond RH951S and the Nagoya UT-108UV mag-mount, but I guess it's not possible to have access to everything in your testing lab.

The antenna I purchased from TOC looks like the A-V85, but states around the connector "FM/138-174/400-520MHz".

Most purchasers of FRS/GMRS radios are unaware that a license is required to operate the radio on the GMRS channels. Most that are aware, don't care. One website estimates that less than 1 in 1000 users are licensed. So it isn't hard to imagine that the FCC collects very little money from issuing GMRS licenses.

The FCC operates under a budget. It does not use the fees that it collects from issuing licenses to operate and it does not get to keep the fees that it collects.

So as it stands today, most GMRS users are unlicensed and it seems that the FCC makes almost no effort to see that anyone gets a license. So in essence, the GMRS is already a license-free service.

So why hasn't the FCC changed GMRS to license-by-rule like the CBRS? Probably because some government bean counter determined that is is cheaper to keep the rules as-is than it would be to formally change them since the end result would virtually be the same.

But until it does formally change, I will continue to keep renewing my GMRS license.

> like finger prints.

That is true, but it has nothing to do with the answer to Jim's question.

The digital signature of each transmitter is unique, and can certainly be used to prove that a particular radio was used to transmit a particular signal. But the FCC very rarely needs to go anywhere near that far to deal with violators. More to the point of answering Jim's question, the digital signature doesn't do the FCC any good in discovering an unlicensed operator or an unauthorized device because the digital signature of the radio itself can only be compared after the radio is confiscated.

As for how the FCC would know that Jim (or anyone else) is illegally using an unauthorized device for their unlicensed operation on GMRS, the simplest way for them to find out is that Jim will tell them. If he doesn't tell them himself, then he will certainly tell someone else, who might decide to tell the FCC.

The FCC does still conduct random monitoring and does still occasionally catch unlicensed operators. When a monitor does detect an unlicensed operator, the FCC does not move instantly, instead they continue monitoring, they record the digital signature of the radio as well as maintaining recordings of the illegal transmissions. When that same unlicensed operator is monitored again, the additional violation is added to the file. When there are enough entries in the file, the FCC will locate and identify the individual, then issue a notice of liability (administrative fine). The only time the digital signature and other data come into play is if the operator is stupid enough to contest the notice and demand a hearing.

Far more often, the initial discovery of an illegal unlicensed operator isn't by random monitoring but rather in response to a complaint. Licensed operators in any service tend to report any unlicensed operations. Even if no one in his area happened to report him directly, all it takes is for there to be several complaints about ANY unlicensed operation in his area. When the FCC receives a complaint, basically they just file it away. Every so often they wade through the file of complaints to see where the most violations appear to be occurring. A particular complaint may well be in the file for a year or more with absolutely no action by the FCC. But eventually there will be enough complaints in an area to get the FCC to take action -- or there may just happen to be one serious complaint (such as some idiot transmitting on a police or fire frequency) -- once the FCC sends an enforcement team into an area they will normally conduct monitoring operations on numerous frequencies and record a large number of violations

before acting on any of them.

So, the FCC probably doesn't care about Jim (or any other individual illegal operator) but if they happen to be monitoring in his area when he (or someone else) mentions using an illegal radio, a letter from the FCC may arrive in his mailbox few months later informing him how many thousand dollars he owes the US government.

> in such topics, I was wondering what would be the recommendations/
> preferences for the following communications scenarios (NOT using the
> UV-5R...we have beat that horse enough):

I am not aware of ANY really good inexpensive radios for GMRS on the market. The vast majority of "GMRS" radios being sold today are the so-called "FRS/GMRS" radios which are basically an FRS radio with more than 1/2 watt power and 8 additional channels. The main thing wrong with these radios is that in order to be legal on the FRS channels, they have a permanently fixed antenna (a really bad rubber duck). The next problem is that they are simplex only, so that cannot be used through GMRS repeaters if one is available in your area.

Real GMRS radios are basically identical to Part 90 radios. Unfortunately most recent Part 90 radios are not certified for Part 95 simply because the radios are capable of being programmed for ham frequencies which makes them ineligible for Part 95 under the provisions of 95.655(a).

A manufacturer can certify one of these radios, but it takes a little bit of smoke and mirrors, the larger companies are not interested in bothering to certify their Part 90 radios for Part 95 because the market for Real GMRS radios is too small.

The least expensive compromise radio that I am aware of certified for GMRS is the PowerWerx GU-16 GMRS handheld -- which is really just a relabeled Wouxun KG-833 that comes preprogrammed for GMRS operation. It sells for $100 and only has 16 memories and comes preprogrammed with 8 simplex and 8 duplex GMRS channels. Its GMRS channels do not include the interstitial channels (which are the same as FRS channels 1-7); its duplex channels all come preprogrammed for CTCSS tone 141.3 (which is fine if the repeater in your area happens to use that particular tone but useless if the repeater uses any other tone); and all but one of the simplex channels come preprogrammed with Tx and Rx CTCSS, so they work with other GU-16 radios or with radios programmed for the same tone, but cannot normally hear anyone else on the frequency. You could get the Wouxun programming cable and software, then reprogram a GU-16 for whichever GMRS frequencies and tones were useful in your area.

> 1. between family vehicles while traveling (mag mounts would be used)

Put the antenna in the center of the roof if at all possible.

> 2. between family residences in a neighborhood (preferably using the same
> mag mounts indoors)

If you are going to use a mag mount indoors, put it on the top center of a large metal appliance (preferably a refrigerator or freezer) or perhaps a four drawer filing cabinet. Or put the mag mount on top of a metal tray (such as a baking tray) located as high as you can. A better choice would be some sort of base antenna installed as high as possible. Radio Shack model 20-043 or 20-176 are both usable, but personally I prefer the N9TAX SlimJim.

MURS is VHF, limited to 2 watts, and does not require individual licenses

GMRS is UHF, limited to 50 watts, and does require a license. The license covers all members of the named licensee's family regardless of where they live. The authorized family member are
The Licensee; Licensee's spouse; Licensee's children, grandchildren, stepchildren; Licensee's parents, grandparents, stepparents; Licensee's brothers, sisters; Licensee's aunts, uncles, nieces, nephews; and Licensee's in-laws. Review that list and you will see that it can make a big difference whose name is given as the licensee in determining who is included under the one license.

Both services have a limited number of models of certified radios available.

Just because the chances of being caught are very slim does not make it ok to not follow the rules. The people that cry about us "FCC Cops" probably think it is ok to speed, run through stop signs, and run away from accidents if they hit another car when nobody is watching. Those laws are only "suggestions" after all.

Under the circumstances you describe, the chances of getting caught are nearly zero. However, those circumstances require never telling anyone about using a UV-5R and never violating any other rules. Perhaps those circumstances apply to you, but my experience is that maintaining that situation is rare for most operators.

You are correct that in the absence of any violation, the FCC "would have no legal basis to confiscate the radio" but the fact that you hold a license (in any service) means that the FCC already has your permission to inspect your station at any time.

-----Original Message-----
From: Jim Henry

Xaun Loc,

Thank you for a more detailed answer. However, where I was coming from is:
If a person IS licensed for GMRS (I am) and operates according to the rules of the service (I do) but is using a UV-5R and is not causing interference to anyone, how would the FCC know that a radio not certified for Part 95 was being used? They certainly would have no legal basis to confiscate the radio. I think the odds are slim to none for any consequences to such an operator.
To be clear, I own Wouxun and Uniden radios that are Part 95 certified for my GMRS operations and a UV-5R for Amateur Radio use.
Thanks.
Jim

Subject: [baofeng_uv5r] MURS vs GMRS

Before asking this question, I checked out whether there were any Yahoo Groups for GMRS and MURS users...there are, but there has been no activity on either site in 7 days, and membership is very low.

So...since this group seems to have broad experience and knowledge in such topics, I was wondering what would be the recommendations/preferences for the following communications scenarios (NOT using the UV-5R...we have beat that horse enough):

1. between family vehicles while traveling (mag mounts would be used)
2. between family residences in a neighborhood (preferably using the same mag mounts indoors)

I would appreciate comments from people who have actually set up either MURS or GMRS systems.

Note: the suggestion has been made to get a Tech license and I would agree that would offer the best options, but these family members would never go for that effort :)

I am not sure about 1 thing. Does the CTCSS tones available on ham radios match up to the "privacy'' tones of a legal GMRS radio? It is alot easier to change tones on a GMRS radio than the Baofeng. If the tones don't match up, you can only talk to each other with 'no tone'.

1. Between family vehicles while traveling: 11 meter CB is usable. Depending on vehicle spacing, FRS handi-talkies can work pretty well. (I know of one Corvette club that routinely uses FRS handi-talkies for this exact purpose.)

2. Between family residences in a neighborhood: Alexander Graham Bell’s new-fangled invention, the “telephone”, works pretty well for this.

Mike,

Yes, all of the radios I have ordered since the 1st of June, including all current stock, are specified with the A-V85 antenna and all of the UV-5R's are appropriately labeled with the FCC part 90 certification labels.

Mike

FYI, WRT 3 old Crows.....my radio from Kurt came with the antenna pictured on the left. My friends antenna, from Amazon, was similar to the one on the right.....

On Sunday, October 13, 2013 2:24 PM, Michael Black <mdblack98@...> wrote:

You can find the Baofeng antennas on their website. I probably should include a reference or picture in the PDF to distinguish those since they aren't marked and a lot of people may want to know what they have.

http://www.baofengradio.com/en/product.asp?BigClassName=Accessories <http://www.baofengradio.com/en/product.asp?BigClassName=Accessories&Smallclassname=Antenna>
&Smallclassname=Antenna

What most people refer to as the "stock" antenna is the UV-5R Logo though the term "stock" is technically incorrect. It's what most people get and I do believe the default if the dealer doesn't ask for something different.

That’s the one of the left below…the A-V85 is the one on the right. Both have white-on-black printing around the jack with FM/138-174/400-480MHz printed on it.

I know threeoldcrows only ships with the A-V85…don’t know about anybody else.

Subject: Re: [baofeng_uv5r] Antenna Testing

Mike, I see that besides you, Mr Pryor has also had good luck with the Harvest RH660 antenna.
I am wondering where did you buy this particular model and if we know if there are fakes around as well. ????
A search on line revealed that the antenna with a SMAF is readily available on ebay form a seller for about $20 delivered. There is also a seller on alibaba selling them for $15 delivered
http://www.aliexpress.com/store/product/Harvest-RH-660S-telescopic-antenna-for-UV-5R-walkie-talkie-SMA-Fmale/714302_718086252.html

I am wondering if any of these sources will supply a well performing version???

My thinking is to use it at home instead of the ducky

WRT the Baofeng antennas, could you provide photos of which model is which?? I have seen 2 different ones. One I got from threeoldcrows and another my friend got from an amazon source. I did post pictures of the two radios/antennas side by side.

WRT the Smiley 270a, they have 2 different SMAF connectors. is yours the one with the recessed teflon face or flush face??? My Smiley does not seem to do much for me compared to the Baofeng ducky.....

Tony

On Saturday, October 12, 2013 12:22 PM, Michael Black <mdblack98@...> wrote:

I’ve attached a PDF of the antenna testing I’ve done which now includes both VHF and UHF. Looks like the list now accepts attachments.

Thanks for all the comments. Any more comments are more than welcome.

Here’s what I’ll call the winners:

Overall winner: Harvest RH-660S -- but it’s really awkward to use and would strain the connector on the radio unless you’re not moving the radio. So as a semi-base station setup it’s the definite winner.

Extendable winner: Smiley 270A – given that ~40” extendables are a pain to use the Smiley is 21” – but you do have to collapse the top 2 sections for UHF performance.

Fixed length winner(s): Diamond RH771 and Powerwerx WXGAT-ST – both performed about the same less then 1dB apart

Short length winner: Baofeng A-V85 – note this is not the Baofeng antenna the comes with most UV-5R's. The Baofeng stock antenna (A-5R Logo) you get from most dealer's is bad on VHF but OK on UHF (-9dB and -0.7dB respectively).

If you want better UHF coverage than the Baofeng antennas the Diamond RH771 and Powerwerx WXGAT-ST both performed well in the 15" category and are only beat by the really long (~40") extendables.

Since the mail list archive will cut off at 64kB here is a subset of the tables in the PDF.

Red is extendables, blue is mag mounts, black is fixed length

That is true, but it has nothing to do with the answer to Jim's question.

The digital signature of each transmitter is unique, and can certainly be used to prove that a particular radio was used to transmit a particular signal. But the FCC very rarely needs to go anywhere near that far to deal with violators. More to the point of answering Jim's question, the digital signature doesn't do the FCC any good in discovering an unlicensed operator or an unauthorized device because the digital signature of the radio itself can only be compared after the radio is confiscated.

As for how the FCC would know that Jim (or anyone else) is illegally using an unauthorized device for their unlicensed operation on GMRS, the simplest way for them to find out is that Jim will tell them. If he doesn't tell them himself, then he will certainly tell someone else, who might decide to tell the FCC.

The FCC does still conduct random monitoring and does still occasionally catch unlicensed operators. When a monitor does detect an unlicensed operator, the FCC does not move instantly, instead they continue monitoring, they record the digital signature of the radio as well as maintaining recordings of the illegal transmissions. When that same unlicensed operator is monitored again, the additional violation is added to the file. When there are enough entries in the file, the FCC will locate and identify the individual, then issue a notice of liability (administrative fine). The only time the digital signature and other data come into play is if the operator is stupid enough to contest the notice and demand a hearing.

Far more often, the initial discovery of an illegal unlicensed operator isn't by random monitoring but rather in response to a complaint. Licensed operators in any service tend to report any unlicensed operations. Even if no one in his area happened to report him directly, all it takes is for there to be several complaints about ANY unlicensed operation in his area. When the FCC receives a complaint, basically they just file it away. Every so often they wade through the file of complaints to see where the most violations appear to be occurring. A particular complaint may well be in the file for a year or more with absolutely no action by the FCC. But

eventually there will be enough complaints in an area to get the FCC to take action -- or there may just happen to be one serious complaint (such as some idiot transmitting on a police or fire frequency) -- once the FCC sends an enforcement team into an area they will normally conduct monitoring operations on numerous frequencies and record a large number of violations before acting on any of them.

So, the FCC probably doesn't care about Jim (or any other individual illegal operator) but if they happen to be monitoring in his area when he (or someone else) mentions using an illegal radio, a letter from the FCC may arrive in his mailbox few months later informing him how many thousand dollars he owes the US government.

> Karl,

One minor clarification... You were getting through the repeater. You just couldn't hear it with the second radio because the second radio's receiver was rendered inoperative by the strong, off-frequency (600 KHz on VHF) transmission from the first radio.

Get someone from a local repeater group to give you a tour of the repeater. Have them show you the special equipment that is necessary to allow the receiver to be able to continue to receive while the transmitter is transmitting. It also allows the receiver and transmitter share the same antenna.

I'm glad you got it sorted out.

I plan on doing just that until I get to running down the battery down three times. I had a chance to use the radio yesterday during a Communications Supported event with CERT and ARES, the radio worked really nice and did very well on the repeater we had used throughout the entire event - Glad that I decided to buy that radio! - A well deserved pat on my own back!

Thanks to Jim and those who helped me last week in getting me to program my radio by hand, think I'm now getting the feel of being able to program that radio out in the field now without or when a computer is not available. Thanks again guys!

From: Lonney
Topic: 35260 Message: 35313

Thanks for the suggestions and info!

I'll check the driver version next time I need to change something.

I connected the USB plug to the same port to start with, and different USB ports once it wasnt working - with the same result. Once the radio goes into TX, it stays locked transmitter on until I turn the radio off, and I get an angry COM20 in device manager. Removing the programming cable does nothing.

I have disabled Windows from updating drivers via Windows update, so it wont even try that for drivers.

Thanks for this really specific and useful response...I have been
Googling the whole subject extensively and as yet have never come across
the PowerWerx unit you mention...sounds like an interesting option.

The suggestion on the base antenna for use at home is a good one.

I am still in the heavy research mode on this topic and one new piece of
information usually leads to a new potential plan and/or idea...

Since GMRS can run up to 50 watts, can you point to any mobile units
that run at more watts than the HT units? In our neck of the the woods,
I think repeaters may be scarce...so I would try to maximize range with
more power...also if we were to have them in our cars traveling
together, simplex would be more logical since we would be closer to each
other than to a repeater

I also assume that such units could be programmed for simplex operation
if there are no repeaters available.

Topic: 35270 Message: 35315

Again, thanks for the feedback.

The consensus that I have observed in researching this topic on the Internet is that VHF if better than UHF for mobile/outdoor usage.

I guess the question I am arriving at is this: with my principle goal being communication between family vehicles traveling together, is a VHF-based system of 2 watts with a Tram mag mount (the highest rated one in the testing done by Michael Black) better than a UHF-based system (HT 4-5 watts into a similar mag mount...or possibly using a more powerful, up to 50 watts, mobile unit)?

Or is it a case of six-of-one and half-dozen of another?

jezz,

soooo, someone woefully lacks knowledge of History and History of Amateur radio with the statement (paraphrasing): if you question the gov. and make them prove allegations your "stupid" - sorry, but Washington and Jefferson would roll over in their graves for such a statement !!

They have the burden or proof and persuasion AND obligation to do so under law -- evidence rules --- not letters making allegations - CITIZENS, INDEED PATRIOTS, ALWAYS AND PUT THE STATE TO THEIR TEST as the Const, limits the Gov, power (not the other way around). That is just the way it is after Men were ruled by Tyrants ---Washington and Jefferson dealt with tyrants (King George) -- read it yourself -- US Const. and the Bill of Rights.

AND Men, and Gov., make mistakes

Second, aren't amateur radio tech tinker-ers since day 1 of the hobby - that is surely the spirit of Amateur radio? -- last I knew Citizens were INNOCENT until PROVEN GUILTY -- not the other way around.

1. There are 8 GMRS only frequencies which permit up to 50 watts transmitter power. With a mobile radio and external antenna, you can expect several miles between vehicles. If you use 4 or 5 watt handhelds with an external antenna, you can use those 8 frequencies as well as the first 7 FRS frequencies (which permit up to 5 watts power when used as GMRS), and you can expect perhaps a mile or so between vehicles. Using FRS only (no external antenna permitted), you might get 1/4 mile reliably. If you are using the first 7 FRS channels as GMRS, you must identify with your GMRS license.

2. Ditto above, except you might also have access to a local GMRS repeater, in which case you could be looking at many miles, depending on the repeater location and coverage.

Easiest solution would probably be to use cell phones, given that probably most of your family members already have one you would not be looking at the up front cost of buying multiple radios and antennas.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Before asking this question, I checked out whether there were any Yahoo Groups for GMRS and MURS users...there are, but there has been no activity on either site in 7 days, and membership is very low.

So...since this group seems to have broad experience and knowledge in such topics, I was wondering what would be the recommendations/preferences for the following communications scenarios (NOT using the UV-5R...we have beat that horse enough):

1. between family vehicles while traveling (mag mounts would be used)
2. between family residences in a neighborhood (preferably using the same mag mounts indoors)

I would appreciate comments from people who have actually set up either MURS or GMRS systems.

Note: the suggestion has been made to get a Tech license and I would agree that would offer the best options, but these family members would never go for that effort :)

If you use ur mag about off of the car, you will need some sort of ground plane under the antenna, a flat metal surface or a ground plane kit that can be purchased via eBay. And it would work much better placing the antenna outside and elevated as much as possible you can build a home antenna using wire coat hangers and a chassie Mount so239. You could try googling "coat hanger special antenna"

Before asking this question, I checked out whether there were any Yahoo Groups for GMRS and MURS users...there are, but there has been no activity on either site in 7 days, and membership is very low.

So...since this group seems to have broad experience and knowledge in such topics, I was wondering what would be the recommendations/preferences for the following communications scenarios (NOT using the UV-5R...we have beat that horse enough):

1. between family vehicles while traveling (mag mounts would be used)
2. between family residences in a neighborhood (preferably using the same mag mounts indoors)

I would appreciate comments from people who have actually set up either MURS or GMRS systems.

Note: the suggestion has been made to get a Tech license and I would agree that would offer the best options, but these family members would never go for that effort :)

Regards,

Ed

The current standard for CTCSS tones is EIA standard RS-220. The newest commercial radios with CTCSS are generally capable of all or nearly all of the EIA standard tones. Older radios typically include the original Motorola standard "PrivateLine" (PL) tones. Some software driven radios are actually capable of generating any tone within the range of the standard tones, typically to a 0.1 Hz resolution. (A tone that is off spec by just 0.1 Hz will generally work).

There are 38 tones that are generally considered safe to the extent that any radio with CTCSS probably has them available, many modern radios provide about 50 tones. Until recently hams and knowledgeable GMRS users generally used just the original Motorola tones for better compatibility. Today you are likely to find any of the EIA standard tones being used but the original Motorola tones are still the most popular.

Unfortunately most FRS and GMRS Simplex users today are totally ignorant of what CTCSS is and does, in part this is because the manuals that come with today's toy "FRS/GMRS" radios deliberately describe CTCSS incorrectly to give users the false impression of privacy. This condition is rapidly spreading among the ham community, in part because the few CTCSS related questions on the ham written test do not really address the issues and almost no one today studies anything beside the test questions and answers.

Thanks for the info. I see a nice cat and mouse game coming up to anybody that uses both a Boafeng and a GMRS radio together. The GMRS user will say "goto channel 8, privacy tone 10" or the Baofeng user will say "goto channel 12, tone 107.2". They are going to look at each other and go " huh"?

A group I belong to makes it even simpler. We use 7 combinations of GMRS frequencies, all with TX/RX tones. All radios are programmed identically so when someone says go to Channel 5, we all will always be on the same page.

Unfortunately that's too true. Despite the increased complexity of such testing, I'm wondering if it might be time to consider any written test in conjunction with a separate Oral and Practical "O&P" test, as in some other Federal licensing venues.

Take a look at http://www.mygmrs.com/ for a directory of GMRS repeaters. It isn't complete, and there are almost certainly a few repeaters listed that aren't on the air at the moment, but it is probably the best list available online.

I have not kept up to date on current GMRS mobile radios. Back In The Day, the typical GMRS mobile was a two channel radio with about 20W output, a few fancy folks were running radios capable of 4-10 channels. That was sufficient back when a GMRS license was only good for the specified frequencies. Until several years ago, the tech standards for GMRS radios were essentially the same as the standards for Part 90, so most Part 90 radios were legal for GMRS provided they were equipped with the appropriate GMRS crystals or programmed with GMRS frequencies. Today, the major US/Japanese companies have generally abandoned the GMRS market except for various lines of "FRS/GMRS" handheld radios which are generally over-priced toys.

Any manufacturer, importer, or dealer with a modern Part 90 radio that honestly isn't field programmable could get the radio certified for GMRS, but most simply won't spend the time and money for the tiny market that is still around.

I'm no fan of PRSG, but you will find quite a bit of good information about GMRS at http://home.provide.net/~prsg/wi-gmrs.htm

Subject: Re: [baofeng_uv5r] MURS vs GMRS

Thanks for this really specific and useful response...I have been Googling the whole subject extensively and as yet have never come across the PowerWerx unit you mention...sounds like an interesting option.

The suggestion on the base antenna for use at home is a good one.

I am still in the heavy research mode on this topic and one new piece of information usually leads to a new potential plan and/or idea...

Since GMRS can run up to 50 watts, can you point to any mobile units that run at more watts than the HT units? In our neck of the the woods, I think repeaters may be scarce...so I would try to maximize range with more power...also if we were to have them in our cars traveling together, simplex would be more logical since we would be closer to each other than to a repeater

I also assume that such units could be programmed for simplex operation if there are no repeaters available.

I am not aware of ANY really good inexpensive radios for GMRS on the market. The vast majority of "GMRS" radios being sold today are the so-called "FRS/GMRS" radios which are basically an FRS radio with more than 1/2 watt power and 8 additional channels. The main thing wrong with these radios is that in order to be legal on the FRS channels, they have a permanently fixed antenna (a really bad rubber duck). The next problem is that they are simplex only, so that cannot be used through GMRS repeaters if one is available in your area.

Real GMRS radios are basically identical to Part 90 radios. Unfortunately most recent Part 90 radios are not certified for Part 95 simply because the radios are capable of being programmed for ham frequencies which makes them ineligible for Part 95 under the provisions of 95.655(a).

A manufacturer can certify one of these radios, but it takes a little bit of smoke and mirrors, the larger companies are not interested in bothering to certify their Part 90 radios for Part 95 because the market for Real GMRS radios is too small.

The least expensive compromise radio that I am aware of certified for GMRS is the PowerWerx GU-16 GMRS handheld -- which is really just a relabeled

Wouxun KG-833 that comes preprogrammed for GMRS operation. It sells for

$100 and only has 16 memories and comes preprogrammed with 8 simplex and 8 duplex GMRS channels. Its GMRS channels do not include the interstitial channels (which are the same as FRS channels 1-7); its duplex channels all come preprogrammed for CTCSS tone 141.3 (which is fine if the repeater in your area happens to use that particular tone but useless if the repeater uses any other tone); and all but one of the simplex channels come preprogrammed with Tx and Rx CTCSS, so they work with other GU-16 radios or with radios programmed for the same tone, but cannot normally hear anyone else on the frequency. You could get the Wouxun programming cable and software, then reprogram a GU-16 for whichever GMRS frequencies and tones were useful in your area.

> 1. between family vehicles while traveling (mag mounts would be used)

Put the antenna in the center of the roof if at all possible.

> 2. between family residences in a neighborhood (preferably using the same
> mag mounts indoors)

If you are going to use a mag mount indoors, put it on the top center of a large metal appliance (preferably a refrigerator or freezer) or perhaps a four drawer filing cabinet. Or put the mag mount on top of a metal tray (such as a baking tray) located as high as you can. A better choice would be some sort of base antenna installed as high as possible. Radio Shack

model 20-043 or 20-176 are both usable, but personally I prefer the N9TAX SlimJim.

Actually there are 16 GMRS only frequencies which permit up to 50 W
transmitter power.
8 are 462.xxx MHz used simplex and as repeater outputs, the other 8 are
matching 467.xxx MHz frequencies limited to use as repeater inputs

Hmmm.I've got 2 of these..checked the other one and it says the same as yours.

Both antennas are absolutely physically identical except for the printing around the jack.

Put them both on my MFJ-269B and they both test the same but I can only go to 470MHz. They both show 1.7 SWR at that point.

Sounds like Baofeng expanded the range on the identical antenna perhaps and just changed the labeling to match the radio specs?

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

Though I empathize with the sentiment and even agree that breaking the law to save the Republic is arguably the morally correct thing in this instance, I would be more circumspect in advertising this kind of thing. The Head Occupier is now The Occupier in Chief and his minions have infiltrated every agency of the Government including the FCC. And make no mistake, these boys are playing for keeps and they don't take prisoners.

As for "leaving politics at the door" and only discussing the Baofeng UV5X radios suggested by Gary Dunn, I'm not certain that is possible when politics directly affect it's use. For myself I am perfectly willing to do that. I'm perfectly willing to get a ticket to play with the radios and abide by the rules. But I don't agree with limiting freedom of speech in this forum (see the definition of the word) or any other.

God Bless America and Long Live the Republic!

Dallas

The current standard for CTCSS tones is EIA standard RS-220. The newest commercial radios with CTCSS are generally capable of all or nearly all of the EIA standard tones. Older radios typically include the original Motorola standard "PrivateLine" (PL) tones. Some software driven radios are actually capable of generating any tone within the range of the standard tones, typically to a 0.1 Hz resolution. (A tone that is off spec by just 0.1 Hz will generally work).

There are 38 tones that are generally considered safe to the extent that any radio with CTCSS probably has them available, many modern radios provide about 50 tones. Until recently hams and knowledgeable GMRS users generally used just the original Motorola tones for better compatibility. Today you are likely to find any of the EIA standard tones being used but the original Motorola tones are still the most popular.

Unfortunately most FRS and GMRS Simplex users today are totally ignorant of what CTCSS is and does, in part this is because the manuals that come with today's toy "FRS/GMRS" radios deliberately describe CTCSS incorrectly to give users the false impression of privacy. This condition is rapidly spreading among the ham community, in part because the few CTCSS related questions on the ham written test do not really address the issues and almost no one today studies anything beside the test questions and answers.

35336. Stop getting RF Audio

By the time you get everything set up with an amp, you are very close to paying for a mobile. Why not check on your local area Craigslist or Ebay for a good used unit. More power and no hassles of hooking the ht up to a power source, plugging in the remote mic, removing the rubber duck, and screwing in the coax for the outside antenna and amp. Been there, done that, a real pia.

Add to that, the guaranteed wear on the contacts involved.

IIRC I saw that the plug the antenna uses is good for about 200 mating/unmating operations and the mic jack sticking issues... naw, go for a mobile.

I also did that with an Icom Ic2at, got the "T”shirt, still have the amp and interconnects laying around in a box somewhere. Worked for me at the time, but then I fix the stuff.

Long, long ago, Motorola had a drop-in rig for one of their older HTs, they called it Convertacom, IIRC. Nice idea but It seems to have fallen into disuse.

Correct. I did not mention those only to prevent possible confusion about them being available for direct/simplex use. But the 467.xxx repeater offsets of the 8 primary are permitted the same power as the 8 primary, as you noted. Thanks.

Actually there are 16 GMRS only frequencies which permit up to 50 W
transmitter power.
8 are 462.xxx MHz used simplex and as repeater outputs, the other 8 are
matching 467.xxx MHz frequencies limited to use as repeater inputs

Is there a good tutorial/online resource on the narrow/wide band differences (= frequency step size, 2 or 5 or 12.5 etc) ?
I get the basics but I'm interested in the impacts that setting a different step amongst radios in a same group and home frequency would have – like is a narrow vs. wide combination going to prevent one radio from being able to listen/receive a transmission?
If you set A to 2.5 and the other, B, to 25 – does that mean that B will be able to listen to A but A won't, because A is 'scanning' a very narrow band of the frequency while B is set to 'listen' to a wide one?

Thanks.

> Also check to see if you are in wide or narrow band should be wide.

That is PROBABLY (but not necessarily) true on the ham bands (and absolutely wrong on Part 90 frequencies). In any case, this CANNOT be the cause of his problem. At most, having narrow band set on a repeater configured for wide band would give LOW audio, but certainly not a complete lack of audio.

> Then make sure you are in 5.0 steps for frequency steps.

ANY step size that lets him have the proper frequency will work fine. If he is accessing the repeater, then he must already have a usable step size so the step size CANNOT be the cause of his problem.

By the way, 2.5 is a better choice than 5.0 for most users because it will access ALL the potential frequencies.

As many have already explained, the most likely cause of his perceived problem is simply that the radio his is using to transmit is desensing the radio he is using to receive.

Other possibilities could be a defective microphone in the radio, a defective case with NO hole over the microphone, or a defective mic plug on the radio. These have all been known to happen, but they are much less common than simple desensing of the receiver.

I believe the general consensus is that the menu reset is pretty useless.

Without a programming cable you can't really reset it properly.

Can't say I've heard anybody else on this list with your problem though.

So I think your only choice at this point would be to return it if you don't want to buy a programming cable.

You’re confusing step size with wide/narrow band. They aren’t the same thing at all.

Step size simply determines what happens when you press the up/down key on your radio and what happens when you key in a frequency (rounding).

I keep mine on the smallest setting which is the most flexible for entering frequencies for me.

Wide/narrow band is only relevant for amateur/commercial bands respectively.

Amateur bands all use wide band.

Commercial band had to switch over to narrow band to open up available frequencies.

So for normal amateur use keep it wide.

Mike W9MDB

Subject: [baofeng_uv5r] More about Wide/Narrow (Steps)] RE: Can not get audio through repeaters

Is there a good tutorial/online resource on the narrow/wide band differences (= frequency step size, 2 or 5 or 12.5 etc) ?

I get the basics but I’m interested in the impacts that setting a different step amongst radios in a same group and home frequency would have – like is a narrow vs. wide combination going to prevent one radio from being able to listen/receive a transmission?

If you set A to 2.5 and the other, B, to 25 – does that mean that B will be able to listen to A but A won’t, because A is ‘scanning’ a very narrow band of the frequency while B is set to ‘listen’ to a wide one?

Thanks.

From: wekinne@...

> Also check to see if you are in wide or narrow band should be wide.

That is PROBABLY (but not necessarily) true on the ham bands (and absolutely wrong on Part 90 frequencies). In any case, this CANNOT be the cause of his problem. At most, having narrow band set on a repeater configured for wide band would give LOW audio, but certainly not a complete lack of audio.

> Then make sure you are in 5.0 steps for frequency steps.

ANY step size that lets him have the proper frequency will work fine. If he is accessing the repeater, then he must already have a usable step size so the step size CANNOT be the cause of his problem.

By the way, 2.5 is a better choice than 5.0 for most users because it will access ALL the potential frequencies.

As many have already explained, the most likely cause of his perceived problem is simply that the radio his is using to transmit is desensing the radio he is using to receive.

Other possibilities could be a defective microphone in the radio, a defective case with NO hole over the microphone, or a defective mic plug on the radio. These have all been known to happen, but they are much less common than simple desensing of the receiver.

> up, you can only talk to each other with 'no tone'.

The current standard for CTCSS tones is EIA standard RS-220. The newest commercial radios with CTCSS are generally capable of all or nearly all of the EIA standard tones. Older radios typically include the original Motorola standard "PrivateLine" (PL) tones. Some software driven radios are actually capable of generating any tone within the range of the standard tones, typically to a 0.1 Hz resolution. (A tone that is off spec by just 0.1 Hz will generally work).

There are 38 tones that are generally considered safe to the extent that any radio with CTCSS probably has them available, many modern radios provide about 50 tones. Until recently hams and knowledgeable GMRS users generally used just the original Motorola tones for better compatibility. Today you are likely to find any of the EIA standard tones being used but the original Motorola tones are still the most popular.

Unfortunately most FRS and GMRS Simplex users today are totally ignorant of what CTCSS is and does, in part this is because the manuals that come with today's toy "FRS/GMRS" radios deliberately describe CTCSS incorrectly to give users the false impression of privacy. This condition is rapidly spreading among the ham community, in part because the few CTCSS related questions on the ham written test do not really address the issues and almost no one today studies anything beside the test questions and answers.

Even if they are Part 90, that doesn't make them Part 95 which is required for GMRS. Can't be certified for FRS because of at least the removable antenna.

Dallas, the only main problem will be what you will hear in the speaker.

CW, by its very nature has no modulation except its presence or absence. It’s a carrier (RF signal) either there or not there, on and off as the transmitter is keyed on and off to create the sequence of dots and dashes to form the character. Actually, you could argue that Morse CW is the first form of digital data transmission, requiring a human decoder/encoder.

At best, with the 5r’s squelch set to zero, you will hear background noise being turned on and off by the CW carrier being present or not. Curiously, the sound (unsquelched background noise) you will hear will be the inverse of the Morse characters, hiss with no signal, silence with.

Radios that are intended to receive CW have a method of creating a tone when the signal is detected - tone, on (the dot or dash), silence, off (the space between the dots and dashes).

Probably could take a hint from the folks who were attempting to turn the 5r into a repeater, attaching a tone generator’s on/off control to the carrier present/detected point on the circuit board.

And yes, there is Modulated CW, constant carrier with the tone being turned on and off with the key, but I do not believe it’s commonly used, except by prearrangement.

According to the specs this is an H777 which is absolutely not FRS legal (due to the removable antenna), but it certainly COULD be certified for GMRS (just like the Wouxun that is certified for GMRS) because it isn't field programmable. The company would just need to ship it programmed for GMRS frequencies. Other online articles show a version of the H777 being delivered preprogrammed for US GMRS frequencies.

Of course it faces the usual problem of a radio that is simply preprogrammed for GMRS frequencies -- you still need to reprogram the radio (at least the tones) if you are going to access a GMRS repeater or communicate with people who have any different model radio.

It is certainly possible, Good Buddy. You can find plenty of foot warmers on eBay and other online sources.

It won't do nearly as much good as you imagine.

VHF and UHF communications are line of sight, and that power has very little impact at all. A decent antenna on the roof of your car will make more difference than any increase in power.

There is some chance that you might find some repeater where your 4W signal would be less than adequate but a 20W signal would be readable, but by and large with a decent mobile antenna you should be able to reach most repeaters that you can hear clearly.

-----Original Message-----
From: Kerry L

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

Every revision of the ham license testing procedures in the last 40 years has been to make the test simpler.

There will never be any practical test because any such test is subjective, requires a competent person to evaluate the applicant's response, and requires too much testing time.

One of the early simplifications of the test was the elimination of the Morse code sending test. The requirement for new or upgrading hams to demonstrate the ability to send Morse code was dropped because the FCC couldn't find enough of their own people who could copy code well enough to tell is applicants were right to wrong.

Another of the simplifications of the written test was the elimination of all questions that asked the applicant to draw a circuit diagram. These were replaced by questions that asked the applicant to identify the kind of circuit shown in a picture because the FCC did not have enough qualified people to score the original tests.

Fill in the blank questions were replaced with multiple choice for basically the same reason.

What model mag mount are you using?

I just did some testing on several:

The top three vary by less than 2dB on VHF so are basically equal on VHF but
the BR-80 shines on UHF (and you pay for it with antenna height).

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

Dual band amps can be quite expensive. On a single band amp, if you want to use the other band, usually you have to turn off the amp or disconnect it from the system first. On some models it would automatically save itself from damage from the wrong band.

Yes; CTCSS is an international standard and any radio so equipped
will be compatible with any other (though you may come across a
set that does not include all possible tones).

sexta-feira statements are theoretically correct. I found by experience that if the steps are set to 2.5 it forced the xmitter to narrow band and extremely weak signal audio though it would "key up" the repeater.

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

You’re confusing step size with wide/narrow band. They aren’t the same thing at all.

Step size simply determines what happens when you press the up/down key on your radio and what happens when you key in a frequency (rounding).
I keep mine on the smallest setting which is the most flexible for entering frequencies for me.

Wide/narrow band is only relevant for amateur/commercial bands respectively.
Amateur bands all use wide band.
Commercial band had to switch over to narrow band to open up available frequencies.
So for normal amateur use keep it wide.

Subject: [baofeng_uv5r] More about Wide/Narrow (Steps)] RE: Can not get audio through repeaters

Is there a good tutorial/online resource on the narrow/wide band differences (= frequency step size, 2 or 5 or 12.5 etc) ?
I get the basics but I’m interested in the impacts that setting a different step amongst radios in a same group and home frequency would have – like is a narrow vs. wide combination going to prevent one radio from being able to listen/receive a transmission?
If you set A to 2.5 and the other, B, to 25 – does that mean that B will be able to listen to A but A won’t, because A is ‘scanning’ a very narrow band of the frequency while B is set to ‘listen’ to a wide one?

Thanks.

> Also check to see if you are in wide or narrow band should be wide.

That is PROBABLY (but not necessarily) true on the ham bands (and absolutely wrong on Part 90 frequencies). In any case, this CANNOT be the cause of his problem. At most, having narrow band set on a repeater configured for wide band would give LOW audio, but certainly not a complete lack of audio.

> Then make sure you are in 5.0 steps for frequency steps.

ANY step size that lets him have the proper frequency will work fine. If he is accessing the repeater, then he must already have a usable step size so the step size CANNOT be the cause of his problem.

By the way, 2.5 is a better choice than 5.0 for most users because it will access ALL the potential frequencies.

As many have already explained, the most likely cause of his perceived problem is simply that the radio his is using to transmit is desensing the radio he is using to receive.

Other possibilities could be a defective microphone in the radio, a defective case with NO hole over the microphone, or a defective mic plug on the radio. These have all been known to happen, but they are much less common than simple desensing of the receiver.

Also, while this seller shows 5 watts output power, the majority of sellers rate it at <5 watts (meaning less than 5 watts). What
I've seen is between 2 - 3 watts. Still not bad and most times you'll not notice the difference.

I did not see anything that shows FCC Part 95 Certification in that ad, just a claim that the radio was FRS/GMRS, which really
means nothing. Without the statement ☐FCC Part 95 Certificated☐ and the appropriate FCC certification number I would be extremely
suspicious as the Chinese are well know to state a lot of erroneous claims in their advertising.

35368. UV-5r/BF F8+ software glitch

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-14 18:41:34 UTC
From: <foamhand@...>
Topic: 35368 Message: 35368

OK all, I finally got the software for my BF-F8+ running but its quite glitchy. I am able to write to the radio ok so far but getting the read from radio to work is sporadic. I get a failure to connect error right away sometimes. Sometimes it will read 2/3 of the way thru and then give me a failure to connect error. Sometimes it will complete reading and stay on "parameters in gear". I know my com ports/drivers etc. are ok because it will let me write to the radio and it will read completely sometimes. And yes, I have played the uninstall/re-install software game several times.

Is there another issue like data rate, bit or parity in the prolific driver settings going on here? Thanks for any info.

Huh??? You'd be the first person to report such a thing me thinkst.

I don't see any reason why the radio would shift into narrow band based on the step size.

Can you explain how you programmed your radio? Sounds like you programmed the channel with narrow band.

Make sure you are tuned to a quiet channel. Not just radio transmissions, but computer noise, wi-fi noise. etc. I've not needed to, but some have gone as far as removing the antenna when programming.

I tested my UV-5R…set on 2.5kHz step, frequency mode, punch in the transmit freq of our local repeater….key it…and it does not go into narrow band.

Pretty much what I expected it to do.

Does yours go into narrow mode in this situation?

No. The speaker audio is the 2.5MM jack and the mic audio is the 3.5MM jack. If only the contact in the 3.5MM jack is stuck open, all of the internally generated audio (key beeps, voice prompts, etc.) that is routed to the speaker will still be heard.

The contact in the 3.5MM jack that is ahead of the internally generated audio so I'll bet things like CTCSS tones, DCS codes, 1750Hz tone, DTMF tones and alarm are still transmitted over-the-air. Only the microphone element itself is disabled when a 3.5MM plug is inserted into the jack.

Actually if you power on the radio with the [PTT] button pressed, the tail end of the "Frequency Mode" or "Channel Mode" voice prompt (depending on the mode the radio is in when powered on) will be transmitted over-the-air.

Here's a pair of Motorola FRS/GMRS radios that are legal, can be configured
without a computer, includes NOAA weather and are cheaper.

Could you or anyone please provide a link on where to find the BR-80? I have Googled it unsuccessfully.

The Tram Browning web site is a pathetic example of online marketing...I am not going to click on 32 links to pages of slowly loading PDF files to find one antenna.

Regards,

Ed

In response to the other guy:

Google “browning br-80 antenna” doesn’t bring up anything useful.

Bing “browning br-80 antenna” brings up a TON of hits for a Tram Browning BR-180 dual band (VHF/UHF) mobile antenna.

Could the “BR-80” in the chart be a transcription error?

What model mag mount are you using?

I just did some testing on several:

The top three vary by less than 2dB on VHF so are basically equal on VHF but the BR-80 shines on UHF (and you pay for it with antenna height).

Subject: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a

day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

While you can get an idea of where the individual is located based on their IP address, some users have gone to great lengths to mask their true identities, so most folks simply assume that they are located within the U.S. (as most seem to be). Based solely on that assumption (which can be wrong), many of the answers provided on this forum (and many others) may, in fact, be incorrect if the end-user is outside of the U.S.

The other "given" is that most new folks to the forum will either ignore the search options (to see previous answers to the same question), don't know the search option even exists, don't want to spend their time to find out, or perhaps live in a different country (that may allow different frequency uses), so they ask the question of "how can I do ...." vs. "is it legal to do ....".

I don't envy the work of the moderators, since an answer given to an end-user in Australia that's perfectly justified (i.e. - legal there), is normally seen by many others on the forum (where the answer could cause the end-user to perform an illegal operation).

Of course a certain small percentage of the population within the U.S. (and elsewhere probably) could care less about "regulations" and generally feel their chances of being caught are so small as to ignore any rules, as they are always meant for "someone else" and not meant for them, unless they are specifically stated as such within the original U.S. Constitution and signed by John Adams and his fellow patriots.

You might want to think carefully about admitting in public to intentional creation of harmful interference. Last time I looked, the penalties, originally prescribed by the Communications Act of 1934 and, at least as far as I know, never reduced, were STIFF.

The current standard for CTCSS tones is EIA standard RS-220. The newest commercial radios with CTCSS are generally capable of all or nearly all of the EIA standard tones. Older radios typically include the original

Motorola standard "PrivateLine" (PL) tones. Some software driven radios are actually capable of generating any tone within the range of the standard tones, typically to a 0.1 Hz resolution. (A tone that is off spec by just 0.1 Hz will generally work).

There are 38 tones that are generally considered safe to the extent that any radio with CTCSS probably has them available, many modern radios provide about 50 tones. Until recently hams and knowledgeable GMRS users generally used just the original Motorola tones for better compatibility. Today you are likely to find any of the EIA standard tones being used but the original Motorola tones are still the most popular.

Unfortunately most FRS and GMRS Simplex users today are totally ignorant of what CTCSS is and does, in part this is because the manuals that come with today's toy "FRS/GMRS" radios deliberately describe CTCSS incorrectly to give users the false impression of privacy. This condition is rapidly spreading among the ham community, in part because the few CTCSS related questions on the ham written test do not really address the issues and almost no one today studies anything beside the test questions and answers.

It's highly doubtful that your repeater has a 88.5 tone output, let alone EVERY repeater on your list having a 88.5 tone output. I'd start by removing your 88.5 tone on the various repeater outputs. That should fix your reception problem.

The CTCSS tones shown in the Tone and ToneSql columns of CHIRP (88.5 being the default value) are ignored by CHIRP unless they are required by the Tone Mode column setting (and in some cases the Cross Mode column setting). This is the case here.

For those that are interested, here is how it works.

Tone Mode = (None)
The Tone and ToneSql column values are both ignored.
CTCSS not used

Tone Mode = Tone
The Tone column value is used, the ToneSql column value is ignored.
CTCSS used for transmitting only

Tone Mode = TSQL
The Tone column value is ignored, the ToneSql column value is used.
CTCSS used for both transmitting and receiving

Tone Mode = Cross
Cross Mode = Tone->Tone
The Tone column value and ToneSql column value are both used
CTCSS used for transmitting and a different CTCSS used for receiving

Tone Mode = Cross
Cross Mode = ->Tone
The Tone column value is ignored, the ToneSql value is used
CTCSS is used for receiving only

For those that are confused by the default values being displayed even though they aren't being used, you can select View from the Menu Bar and then enable "Hide Unused Fields". All unused fields will be blanked out.

You're right…transcription error. Browning BR-180.

This is where I got mine plus the magmount

Subject: Re: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

In response to the other guy:

Google "browning br-80 antenna" doesn't bring up anything useful.

Bing "browning br-80 antenna" brings up a TON of hits for a Tram Browning BR-180 dual band (VHF/UHF) mobile antenna.

Could the "BR-80" in the chart be a transcription error?

What model mag mount are you using?

I just did some testing on several:

The top three vary by less than 2dB on VHF so are basically equal on VHF but the BR-80 shines on UHF (and you pay for it with antenna height).

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

Walmart has it online less than Amazon.

http://www.walmart.com/ip/Browning-BR-180-Amateur-Dual-Band-Mobile-Antenna/24262914

Bought one as a Christmas present for my Dad.

Free sit to store pick up also.

Subject: UV-5R+ Charger Issue

Greetings to all, this is my first post to this group. I've had my unit only for a couple of days and have successfully programmed the radio using Chirp.

I was able to get an initial charge using the drop in charger but now the charger appears to have become inoperative. There is no LED light when the wall wart is plugged in, and the output at the plug to the drop in charger is less than 1 V DC when it is supposed to be about 10 V.

Has anybody else experienced this? Can I simply use a 12 V supply to power the charger?

73,
Scott, nt5sm

Subject: UV-5R+ Charger Issue

Greetings to all, this is my first post to this group. I've had my unit only for a couple of days and have successfully programmed the radio using Chirp.

I was able to get an initial charge using the drop in charger but now the charger appears to have become inoperative. There is no LED light when the wall wart is plugged in, and the output at the plug to the drop in charger is less than 1 V DC when it is supposed to be about 10 V.

Has anybody else experienced this? Can I simply use a 12 V supply to power the charger?

73,
Scott, nt5sm

Dallas; CW is really cool! I had to learn it 45 years ago in order to get my license, I wasn't fond of having to do it, but I am glad I did! Most of my radio on the air time is spent on CW. One of our ham bands is only CW, the 30 meter band. I have many little QRP radios that are CW only. Go for it, there is a learning curve, but you can do it! MFJ makes a CW interface so you can use you UV5R on the air for CW fun; it is MFJ-552. This would be great to get with friends and learn CW, the Morse code! GL, 73, de KO8S, Karl

Subject: [baofeng_uv5r] UV-5 and CW

Just wondering if the UV-5 would be appropriate for CW. It will likely be my first radio and CW is something I'd definitely like to learn. Are there portions of the legal bands covered by the radio where CW is permitted and if so could one find a commercially available keyer that would plug into the mike jack? Has anyone here ever used the radio for this purpose?

Something about hearing Morse on a radio just intrigues me to no end ...

Dallas

The current standard for CTCSS tones is EIA standard RS-220. The newest commercial radios with CTCSS are generally capable of all or nearly all of the EIA standard tones. Older radios typically include the original Motorola standard "PrivateLine" (PL) tones. Some software driven radios are actually capable of generating any tone within the range of the standard tones, typically to a 0.1 Hz resolution. (A tone that is off spec by just 0.1 Hz will generally work).

There are 38 tones that are generally considered safe to the extent that any radio with CTCSS probably has them available, many modern radios provide about 50 tones. Until recently hams and knowledgeable GMRS users generally used just the original Motorola tones for better compatibility. Today you are likely to find any of the EIA standard tones being used but the original Motorola tones are still the most popular.

Unfortunately most FRS and GMRS Simplex users today are totally ignorant of what CTCSS is and does, in part this is because the manuals that come with today's toy "FRS/GMRS" radios deliberately describe CTCSS incorrectly to give users the false impression of privacy. This condition is rapidly spreading among the ham community, in part because the few CTCSS related questions on the ham written test do not really address the issues and almost no one today studies anything beside the test questions and answers.

35404. CHIRP doesn't show firmware number

Date: 2013-10-15 15:59:02 UTC
From: Steven DeSalvo
Topic: 35405 Message: 35405

I'm waiting for my uv5r to come in the mail. in the meantime I'm trying to set up the chirp program (save frequencies so i just have to connect and transfer) I set up an account with radioreference.com to download the frequencies on the chirp software but it states I need a premium account. is there another way, it sucks to use a free program when you still have to pay for another to make things easier. I could add them one by one but that is tedious and I won't know if it will be correct until I get my radio. can someone please help, thank you.

I also have an Arrow antenna. Mine is their Open Stub J Pole model OSJ 146/440. This antenna works very well with my UV-5RB. I have it mounted outdoors at about 15 feet. It needs to be higher. I think the Arrow Antenna is very well built and for $39, it's hard to beat. The SWR of this antenna is very low across both bands and that is extremely important when you only have 4-5 watts to work with. Here is the link for the Arrow OSJ 146/440 antenna:
 http://arrowantennas.com/osj/j-pole.html

Hi Ed,

I don't think the GMRS license fee is worth it. The FCC is charging you $85 for this license. I think I'd just get a couple FRS radios instead. Just my 2 cents.

35414. Re: [baofeng_uv5r] UV-5 and CW

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-15 16:13:25 UTC
From: Xaun Loc
Topic: 35352 Message: 35414

CW is legally permitted on nearly all the ham frequencies – although it would be absolutely be considered NOT “good amateur practice” on most of the amateur frequencies within the range of this radio.
It would be possible to send CW with this radio, but nearly impossible to receive CW because the UV-5R is FM.

If you are interested in CW, a used ham receiver or transceiver for the HF bands would be a far better choice.

From: xthunderheartx@...

Just wondering if the UV-5 would be appropriate for CW. It will likely be my first radio and CW is something I'd definitely like to learn. Are there portions of the legal bands covered by the radio where CW is permitted and if so could one find a commercially available keyer that would plug into the mike jack? Has anyone here ever used the radio for this purpose?

Something about hearing Morse on a radio just intrigues me to no end ...

Dallas

35415. Re: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-15 16:22:15 UTC
From: Xaun Loc
Topic: 35334 Message: 35415

Dual band amps are a VERY bad choice with the UV-5R, especially for VHF operation.

The UV-5R has very poor harmonic suppression (barely legal) which means that when it transmits on VHF it simultaneously puts out a weak signal on UHF (at exactly three times the VHF frequency). A good VHF-only amplifier would normally have enough harmonic suppression to avoid amplifying the UV-5R's spurious UHF emission, but a dual band amp is designed to operate on both VHF and UHF, so it would amplify both the legitimate VHF signal and the spurious UHF emissions at the same time

From: Jardy Dawson
Dual band amps can be quite expensive. On a single band amp, if you want to use the other band, usually you have to turn off the amp or disconnect it from the system first. On some models it would automatically save itself from damage from the wrong band.

Jardy Dawson

There are some ht's that have "practice cw" features built into them. I think the Yaesu VX-8 is one of them.

Are there portions of the legal bands covered by the radio where CW is permitted and if so could one find a commercially available keyer that would plug into the mike jack? Has anyone here ever used the radio for this purpose?

Before I would go to the expense and trouble of returning the radio because of a defective power supply, I would just buy another power supply. You can get another one from 409shop for less than $5 shipped.

http://www.409shop.com/409shop_product.php?id=108058

My charging cradle actually came with a 12V wall wart, so yes, you can use a 12V supply to power the charging cradle. But be sure it is a true 12V power supply and not a 13.8V supply just called a 12V supply. The higher the input voltage, the hotter the regulator IC in the charging cradle gets. It does not have a heat sink. Even though the IC is rated for a higher input voltage, it will shut itself down just a bit above 13V because of the higher temperature created by knocking the higher voltage down to 8.4V.

Topic: 35334 Message: 35420

Rather than add an amplifier to the UV-5R, or any other HT, I believe a better use of your money would to be to buy any of a number of low cost mobile VHF rigs. If you really don't need dual band, there are some good 2m-only rigs for less than $150 USD.

Paul - AE5JU

---In baofeng_uv5r@yahoogroups.com, <xaunloc@gmail.com> wrote:

Dual band amps are a VERY bad choice with the UV-5R, especially for VHF operation.

The UV-5R has very poor harmonic suppression (barely legal) which means that when it transmits on VHF it simultaneously puts out a weak signal on UHF (at exactly three times the VHF frequency). A good VHF-only amplifier would normally have enough harmonic suppression to avoid amplifying the UV-5R's spurious UHF emission, but a dual band amp is designed to operate on both VHF and UHF, so it would amplify both the legitimate VHF signal and the spurious UHF emissions at the same time

From: Jardy Dawson
Dual band amps can be quite expensive. On a single band amp, if you want to use the other band, usually you have to turn off the amp or disconnect it from the system first. On some models it would automatically save itself from damage from the wrong band.

It isn't that simple. You have to download from the radio to get a UV-5R compatible template. That is what you edit and upload to the radio.

You can edit a generic template, but when you get the radio you still have to download from the radio and then transfer the channels from the generic template to the UV-5R template.

You could 'cheat' by getting a UV-5R template from someone else and edit it. Then it would be ready to transfer.

But before you do I would recommend that you download from the radio before pressing any buttons to save a pristine image of the factory channels and settings as a 'backup'.

> I set up an account with radioreference.com to download the frequencies
> on the chirp software but it states I need a premium account. is there
> another way, it sucks to use a free program when you still have to pay for
> another to make things easier.
>
You could donate some money to the CHIRP developer.

> I could add them one by one but that is tedious and I won't know if it
> will be correct until I get my radio. can someone please help, thank you.
>
Adding channels by using the "Query Data Source" feature of CHIRP does not guarantee that the added channels are correct.

Thank you, I guess I will just have to wait until my unit arrives in the mail. I don't know anyone who has a uv5r. My friends have wouxuns. I will be using this radio for two main reasons. I'm an EMT (emergency medical technician) and I would like to use it to listen (NOT tx) to our police frequency while on duty to get a head start on certain jobs. (Major accidents, shootings, unconscious patients) those jobs come over the police frequency before it gets to ours. I would also like to listen to ems/pd/fire frequencies while off duty as well. Like I mentioned before, a few friends/partners have wouxuns and I would like to communicate with them (not through any repeaters, just by line of sight, don't know the actual definition of that. Sorry for the lack of technical words but I'm in the process of reading ham radios for dummies and will hopefully soon get my license. Thank you for your help.

You could get a CHIRP image from here...
http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/

I'd probably recommend the BFS311 since that is the latest I have and your radio will probably have it if not a later version.

You will be able to edit this image and once you've backed up your radio with CHIRP, you will be able to load your image right in.

Also if your friends with Wouxuns use CHIRP, you could get a CHIRP image from them so you can copy and paste the channels from their image to your UV-5R image. If theirs works, then yours will work. That's the beauty of CHIRP.

Hello. I explain.

I have a uv3r and uv5rb.

I put my uv3r in my car with an antena 5/8 for vhf and only with 2w I hint a lot of repeaters in my zone.
I put my uv5rb and only hit one repeater.
I think thats it´s brokem or it has any defecte in the circuit or any component are badly solded.
The configuration of the radio, tone, ste, etc its ok and in the same way that the uv3r.

I dont know if send to China or buy another new.

I read the forum but dont find one response certly.

Any idea about this problem.

Wow, no wonder some folks have issues with Chirp. Default values being shown that aren't really used? Thanks for the heads up, Jim, but it looks like I'll try RT Systems before Chirp (5 different columns to watch for one simple tone setting plus default values that show a value but are ignored unless another column is marked?). They may have some confusing settings as well, but hopefully not.

Before paying hard earned money for the RT Systems software, why don't you download and open the factory software. You can then enter your settings and then open CHIRP to fine tune your settings. That's what I do.

Subject: Re: [baofeng_uv5r] Can't receive repeater

  Wow, no wonder some folks have issues with Chirp. Default values being shown that aren't really used? Thanks for the heads up, Jim, but it looks like I'll try RT Systems before Chirp (5 different columns to watch for one simple tone setting plus default values that show a value but are ignored unless another column is marked?). They may have some confusing settings as well, but hopefully not.

On Tue, Oct 15, 2013 at 3:34 AM, Jim Unroe <rock.unroe@gmail.com> wrote:
  On Tue, Oct 15, 2013 at 5:31 AM, Craig Carnahan <craig.n7lb@gmail.com> wrote:
  It's highly doubtful that your repeater has a 88.5 tone output, let alone EVERY repeater on your list having a 88.5 tone output. I'd start by removing your 88.5 tone on the various repeater outputs. That should fix your reception problem.

Craig - N7LB

Craig,

The CTCSS tones shown in the Tone and ToneSql columns of CHIRP (88.5 being the default value) are ignored by CHIRP unless they are required by the Tone Mode column setting (and in some cases the Cross Mode column setting). This is the case here.

For those that are interested, here is how it works.

Tone Mode = (None)
The Tone and ToneSql column values are both ignored.
CTCSS not used

Tone Mode = Tone
The Tone column value is used, the ToneSql column value is ignored.
CTCSS used for transmitting only

Tone Mode = TSQL
The Tone column value is ignored, the ToneSql column value is used.
CTCSS used for both transmitting and receiving

Tone Mode = Cross
Cross Mode = Tone->Tone
The Tone column value and ToneSql column value are both used
CTCSS used for transmitting and a different CTCSS used for receiving

Tone Mode = Cross
Cross Mode = ->Tone
The Tone column value is ignored, the ToneSql value is used
CTCSS is used for receiving only

For those that are confused by the default values being displayed even though they aren't being used, you can select View from the Menu Bar and then enable "Hide Unused Fields". All unused fields will be blanked out.

Rather than add an amplifier to the UV-5R, or any other HT, I believe a better use of your money would to be to buy any of a number of low cost mobile VHF rigs. If you really don't need dual band, there are some good 2m-only rigs for less than $150 USD.

Paul - AE5JU

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

Dual band amps are a VERY bad choice with the UV-5R, especially for VHF operation.

The UV-5R has very poor harmonic suppression (barely legal) which means that when it transmits on VHF it simultaneously puts out a weak signal on UHF (at exactly three times the VHF frequency). A good VHF-only amplifier would normally have enough harmonic suppression to avoid amplifying the UV-5R's spurious UHF emission, but a dual band amp is designed to operate on both VHF and UHF, so it would amplify both the legitimate VHF signal and the spurious UHF emissions at the same time

From: Jardy Dawson
Dual band amps can be quite expensive. On a single band amp, if you want to use the other band, usually you have to turn off the amp or disconnect it from the system first. On some models it would automatically save itself from damage from the wrong band.

Note carefully that Walmart and both sellers on Amazon sell the antenna by itself, without any mount or coax. You still need to purchase an NMO mount suitable for your vehicle and sufficient coax to connect the antenna to the radio.

You will also need a way to connect the coax to the radio. For that I would recommend a SMA-F to BNC-F adapter, and a BNC-M to SO-239 pigtail made with RG316. The SMA to BNC adapter eliminates the wear and tear of frequently screwing and unscrewing the connector to the radio. The RG316 is more flexible than the more common RG58 and reduced strain on the radio connector.

In response to the other guy:

Google “browning br-80 antenna” doesn’t bring up anything useful.

Bing “browning br-80 antenna” brings up a TON of hits for a Tram Browning BR-180 dual band (VHF/UHF) mobile antenna.

Could the “BR-80” in the chart be a transcription error?

Subject: RE: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

What model mag mount are you using?

I just did some testing on several:

The top three vary by less than 2dB on VHF so are basically equal on VHF but the BR-80 shines on UHF (and you pay for it with antenna height).

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Could unit be used mobile with an amplifier in the car?

I have the RAX+, which I use in my car with a mag mount antenna. I am able to pick up repeaters from as much as 45 miles on some days. I am fairly certain that I would never be able to transmit that far. What I am wondering, is it possible to put an amp between the unit and the antenna that would increase the output? I have not been able to test anything on the unit other than listening. I have passed my Technician exam, but because this dumb-ass govt is shut down I haven't gotten my call sign. I spend more than four hours a day commuting and want to be able to get as much out of this unit as I can. Hopefully some day I will be able to afford a nice mobile unit, but those will be out of my budget for a long time.
Just looking for any thoughts on this.

Thanks.

Kerry

35442. Re: [baofeng_uv5r] UV-5 and CW

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

Topic: 35352 Message: 35442

The MFJ-552 causes you to transmit MCW (Modulated CW) which is not truly CW. MCW is legal on phone frequencies, but not on frequencies limited to CW and would be inappropriate on the 2M band below 144.600 or on the 70cm band below 444.000 -- as well as on any repeater without the blessing of the owner.

Anyone with an FM receiver would be able to receive your MCW signal (assuming, of course, that they could copy Morse Code at all), but you would still only be able to receive other stations who are also sending MCW.

From: Karl Schwab

Dallas; CW is really cool! I had to learn it 45 years ago in order to get my license, I wasn't fond of having to do it, but I am glad I did! Most of my radio on the air time is spent on CW. One of our ham bands is only CW, the 30 meter band. I have many little QRP radios that are CW only. Go for it, there is a learning curve, but you can do it! MFJ makes a CW interface so you can use you UV5R on the air for CW fun; it is MFJ-552. This would be great to get with friends and learn CW, the Morse code! GL, 73, de KO8S, Karl

From: "xthunderheartx@..." <xthunderheartx@...>

Just wondering if the UV-5 would be appropriate for CW. It will likely be my first radio and CW is something I'd definitely like to learn. Are there portions of the legal bands covered by the radio where CW is permitted and if so could one find a commercially available keyer that would plug into the mike jack? Has anyone here ever used the radio for this purpose?

Something about hearing Morse on a radio just intrigues me to no end ...

If there were still any FRS radios on the market that might be a worthwhile comparison. But I have not seen an FRS radio for sale in a few years. All the ones I see at the moment are the so-called “FRS/GMRS” radios with 22 simplex channels. Those radios are legal for unlicensed (FRS) use ONLY on channels 8-14. Channels 1-7 and 15-22 all require a GMRS license.

Hi Ed,

I don't think the GMRS license fee is worth it. The FCC is charging you $85 for this license. I think I'd just get a couple FRS radios instead. Just my 2 cents.

I appreciate the advice from everyone. You guys all recommend other models, well if I could afford those, I wouldn't have bought a $36 Bao-Feng to begin with. It is a nice little radio, but quite frankly, I only bought it because it is all I can afford. I have checked Craig's List and ebay, but there are not really any good choices in the 50-100 range as far as I can tell.

Thanks anyways, though.

Hey Folks and thanx for all the replies. And I'm sorry for using "CW" more loosely than I should have. What I should have said was would the UV-5 be appropriate for learning to send, or at least copy, Morse Code? I do have a background in engineering and should have realized the "CW" doesn't really apply to FM. Sloppy on my part. Anyway the point is that I'd like to get into the hobby, be able to communicate in an emergency, learn Morse and do the whole thing as cheaply as possible.

Nuts I know but there it is.

You're right-hand column for Hits on your spreadsheet says "2" and "3" and "0" for channel 80, 83, and 75 - did you mean "1" "2" and "2" ??

Would also be nice to know the frequency as the SWR on theses antennas varies a fair bits so that might explain some of the difference too.

I am considering doing four more tests for the upper and lower part of the bands which would show SWR effect but that's going to take me a while.

I just did center band for first look.

Did you try swapping antennas to see if it was just the radio difference?

If not I would also think the FT-60 antenna might be “better” than the Diamond and he was simply picking up more RF – with the poor selectivity of the UV-5R that would seem a reasonable suspicion.

Also…what kind of bikes were you riding? How were you holding your radios? No idea of the effective ground plane for the two of you so swapping antennas and then swapping radios would help pinpoint the cause.

And, of course, you’ve no idea how RF transparent you are -- at least I assume you don’t J

I’ll also bet there are also some electrical differences in the radios as parts get substituted over time with purportedly “electrically equivalent” parts.

Check the ham radio suppliers on the net, a Yaesu FT1900r can be found new for about $130 a very nice VHF radio 55 watts.

I have personally hooked a Baofeng up to a magnetic roof mount antenna in my car (sans linear amp). The results were impressive. I was hitting a repeater 25 miles away and still getting 59 rst reports and neither the repeater or I were on a hill top. Next point, Craigslist is not the panacea of ham equipment that one would believe... The classifieds on http://qrz.com are probably a far better place to look. I just saw a nice mobile rig go for $65 there the other day.

Kerry,

A buddy of mine picked up a very nice Alinco 2m mobile (with bracket & mic) for $20.00 at a local hamfest. Checked it out and it works perfectly so he's going to use it as a dedicated APRS radio for his RV. I don't know if you intend to use it on ham frequencies (or go out of band), but the others are correct, there are "deals" out there.

I have a problem. My UV-5R isnt transmitting audio with the mic on the body of the radio. It only transmits with the earpiece, I need help with this!

35467. Re: [baofeng_uv5r] RE: Re: Could unit be used mobile with an amplifier in the car?

I can second this experience.

When I first received the UV-5R, I tried it out inside my Toyota minivan. I could get the local repeater and that was about it...other, more distant ones might come in with static.

Two days ago, after receiving the little SMA-female to SO-239 adapter piece from Hong Kong, I took my cheapo mag mount which is usually in the house for weekly net meetings with my FT-897D and put it on top of my minivan and connected the UV-5R to it.

I live on the Eastern Shore of Maryland and I drove from Chestertown, MD to Middletown, DE and let it scan the programmed repeaters. We don't have a an awful lot of activity around here, but I was picking up Glen Burnie, Columbia, and Baltimore on the Western Shore. I checked on Google Earth and these are distances of 30 miles or so...having seen this performance, I am not so sure any more that a 50+ watt rig would do any better.

In addition, I have just ordered the Browning BR-180, based on the various comments and tests presented in this forum. It should perform better than the cheapo unit I am using now...I till return that one to its previous place inside the house.

I will put the new one on the minivan for mobile use with the UV-5R. (I hope I never forget to unscrew it before driving into my garage...too bad they don't make hinged models.)

I have one of these also I am just wondering did you buy yours via amazon uk or us .I am just wondering if there is a bad batch of these, as a couple of people have given me reports of a good signal strength but very quiet on voice especially when working through a repeater ,simplex channels are very readable this is using the body microphone within the radio.
I have also heard that the vox side of things tends to over modulate.
Correct me If I am wrong on this, but hey lets face it they are peanuts to buy.

Actually the UV-5R is a far superior radio compared to the Wouxun 920. I haven't tried the Anytone but the reviews that I have seen generally indicate that the Wouxun has it beat. For example, the UV-5R may scan slowly, but at least it receives when it finds a signal while scanning - compared to the Wouxun which scans but cannot receive the signals it finds.

There certainly are advantages to using a true mobile radio in a car rather than any handheld. A real mobile will have a larger speaker, more audio amplification to drive that larger speaker, and a larger display; but a used mobile from any of the major brands is a better and cheaper choice that either of the Chinese mobiles currently available.

From: zip.doe@...

USING THE UV-5R AS A MOBILE IS LIKE USING A PUTTER ON A PAR 5 HOLE (GOLF).

ANYTONE 5888 OR WOUXUN 920 WOULD BE MUCH BETTER.

Sorry, Jim, but as long as the radio is CAPABLE of more than 0.5W on channels 1-7, it CANNOT be certified for FRS on those channels. Simply setting the radio to low power does NOT make it legal (just like setting the UV-5R on low power and putting superglue on the antenna wouldn't make the UV-5R legal for FRS).

Check the manual that comes with any of these 22 channel "FRS/GMRS" radios -- they require a GMRS license on channels 1-7 and 15-22

The UV-5R is not ideal as a mobile, but it is usable.

To stay as cheap as possible, the one thing you do need is an external antenna. You can find a magnet mount dual band antenna on eBay for less than $10 for a Nagoya NA-UT102 although the Nagoya UT-308 for $20 is a better antenna.

Either antenna can be purchased with the SMA-F connector that screws directly to the radio, but unless you are going to use the radio in the car all the time, I would recommend spending just a little more by getting the antenna with a BNC connector and getting a SMA-F to BNC adapter to put on the radio. This would eliminate having to try to screw the radio on and off the cable each time you get in and out of the car. Get an SMA-F to BNC-F adapter with a wider base such as eBay item 221229971008, not one with a skinny base like eBay item 310690194521.

There are better combinations available, but the above would be the cheapest way to go with decent results

From: Kerry LeBlanc

I appreciate the advice from everyone. You guys all recommend other models, well if I could afford those, I wouldn't have bought a $36 Bao-Feng to begin with. Two possible explanations:

1. He had a better antenna, therefore his radio was receiving stronger signals, resulting in the radio front end being overwhelmed by signals from other frequencies (the UV-5R is very susceptible to such problems)

or

2. There are significant differences between individual UV-5R radios due to the quality (or lack thereof) of the components and assembly. Some of these radios are simply more susceptible to noise than other "identical" radios.

The microphone jack on the radio is faulty. It contains a switching mechanism that lets either the onboard or external microphone connect to the transmitter. If the contacts are not closing properly when no external mic is plugged in, the onboard microphone is not connected to the transmitter.

I have one here, brand new, with the same problem. I am waiting for the supplier to send me a replacement jack.

Unfortunately, it seems that if the USB COM port has RTS signal raised, then the radio will transmit.

Windows seems to always keep RTS ON for the Baofeng USB com port.

Once you startup the Chirp software, and start a read or write it works, because the software lowers RTS.

The way I got the RTS to always be off, is to use Virtual Serial Ports Emulator software (VSPE). I have it create a "splitter port" COM 17 to point to my VSPE COM15 port. This allows the VSPE option to keep RTS OFF.

The purpose of a splitter port is to allow many programs to share a single COM port. So many programs can open COM17 to use the Baofeng USB COM15 without any sharing errors. In this case we really do not need any sharing, but it is a way to get RTS turned off.

Hope this helps you.

Regards,

Howard

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

Thanks for the suggestions and info!

I'll check the driver version next time I need to change something.

I connected the USB plug to the same port to start with, and different
USB ports once it wasnt working - with the same result. Once the radio
goes into TX, it stays locked transmitter on until I turn the radio
off, and I get an angry COM20 in device manager. Removing the
programming cable does nothing.

I have disabled Windows from updating drivers via Windows update, so
it wont even try that for drivers.

Xaun,

My older Cobra and Midland manuals agree with what you are saying. But if
you look at a manual from a recent Cobra CX-312 which is currently
available from Walmart, it says "A user must be licensed prior to operating
on Channels 1 through 7 on high power or 15 through 22, which comprise the
GMRS channels of this radio.

http://www.walmart.com/ip/Cobra-CX-312-23-Mile-2-Way-Weather-Resistant-Radio-2pk/23795135

Icom still makes and sells pure FRS units, but their pricing is way too high for this market.

On Wed, Oct 16, 2013 at 10:02 AM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

You are right, nobody wanted the lower powered FRS radios when they could get the GMRS ones so companies bundled them together. Some exporters from China have FRS only versions which look like kid toys.

If there were still any FRS radios on the market that might be a worthwhile comparison. But I have not seen an FRS radio for sale in a few years. All the ones I see at the moment are the so-called “FRS/GMRS” radios with 22 simplex channels. Those radios are legal for unlicensed (FRS) use ONLY on channels 8-14. Channels 1-7 and 15-22 all require a GMRS license.

Hi Ed,

I don't think the GMRS license fee is worth it. The FCC is charging you $85 for this license. I think I'd just get a couple FRS radios instead. Just my 2 cents.

Sorry, Jim, but as long as the radio is CAPABLE of more than 0.5W on channels 1-7, it CANNOT be certified for FRS on those channels. Simply setting the radio to low power does NOT make it legal (just like setting the UV-5R on low power and putting superglue on the antenna wouldn't make the UV-5R legal for FRS).

Check the manual that comes with any of these 22 channel "FRS/GMRS" radios -- they require a GMRS license on channels 1-7 and 15-22

Xaun,

My older Cobra and Midland manuals agree with what you are saying. But if you look at a manual from a recent Cobra CX-312 which is currently available from Walmart, it says "A user must be licensed prior to operating on Channels 1 through 7 on high power or 15 through 22, which comprise the GMRS channels of this radio.

From: kd2eqz@...

> I have a problem. My UV-5R isnt transmitting audio
> with the mic on the body of the radio. It only transmits
> with the earpiece, I need help with this!

Three possible problems:

1. The hole in the case where the mic is located is not open. This is rare by has been known to happen. If this is the problem you would not have any transmit audio using the internal mic -- and the problem would have been that way right from the start.

2. The mic could be bad or its connection might be bad. These are extremely rare, but have been known to happen. Possibly the mic has died or the solder joint wasn't well soldered and has come open. If it is just the solder joint bad, you might be able to fix it with a fine tip soldering iron and a very steady hand.

or

3. The mic connector on the side of the radio might not be closing the connection when you unplug the headset or programming cable. This is not really very common, but it is more common than either of the other two possibilities. The Mic and Earphone connectors are both designed to disconnect their respective circuits when something is plugged into the jack. That circuit should reconnect itself when the plug is removed from the jack BUT SOMETIMES IT DOES NOT CLOSE THE CIRCUIT. You can try banging the radio against your hand to try to jar the connection closed or you can try blowing canned air into the mic jack. If those don't work, you can buy a replacement jack and install it (again, you need a fine tip soldering iron and steady hands) -- or you can just use the headset or a speaker/mic.

Bottom line: If the radio is new, talk to the seller about sending it back as defective. If the radio is not new, it may be possible to fix it, but it is far easier to work around the problem.

Xuan,

On the contrary, Icom not only knows that they market FRS radios, they are still trying to sell them to anyone that wants one. Google Icom IC-4088A for yourself to see one.

Craig

I've bought 2 true dual band mobiles for $125 each on the used market.
They can be used as cross band repeaters..

Topic: 35153 Message: 35498

I read the owners manual. It mentions nothing about attaching the antenna. This leads me to strongly believe th antenna is NOT removable.

Sorry, Jim, but as long as the radio is CAPABLE of more than 0.5W on
channels 1-7, it CANNOT be certified for FRS on those channels. Simply
setting the radio to low power does NOT make it legal (just like setting the
UV-5R on low power and putting superglue on the antenna wouldn't make the
UV-5R legal for FRS).

Check the manual that comes with any of these 22 channel "FRS/GMRS"
radios -- they require a GMRS license on channels 1-7 and 15-22
  Xaun,

My older Cobra and Midland manuals agree with what you are saying. But if you look at a manual from a recent Cobra CX-312 which is currently available from Walmart, it says "A user must be licensed prior to operating on Channels 1 through 7 on high power or 15 through 22, which comprise the GMRS channels of this radio.

Well, for years here in StL, one of our repeaters was used to simply send CW for anyone that wished to
listen in. The operator sat down and hit the repeater from his desk. It was an FM repeater and he simply
used a key on his computer to broadcast the CW into his FM mike and we all listened. Actually, by the time the deal ended, I was copying 24 wpm....I liked that. Now, probably down to maybe 5wpm.
But, if you have a repeater and wish to practice and are a ARRL member, you can always go to their
CW files and listen over your own computer with no AM or FM problems whatsoever.
Donn, KA0SOH

In a message dated 10/16/2013 11:28:17 A.M. Central Daylight Time, xthunderheartx@... writes:

Hey Folks and thanx for all the replies. And I'm sorry for using "CW" more loosely than I should have. What I should have said was would the UV-5 be appropriate for learning to send, or at least copy, Morse Code? I do have a background in engineering and should have realized the "CW" doesn't really apply to FM. Sloppy on my part. Anyway the point is that I'd like to get into the hobby, be able to communicate in an emergency, learn Morse and do the whole thing as cheaply as possible.

Nuts I know but there it is.

First, I'm not a Mac person.

The issue of getting CHIRP to run (or actually getting the programming cable installed) on a Mac has been discussed here several times. You might try using "/dev/cu*" in the Yahoo! search box to look for these discussions.

Or it might save time to start by reviewing the Mac OS Tips on the CHIRP website.

http://chirp.danplanet.com/projects/chirp/wiki/MacOS_Tips

I know the page was recently updated.

You're right – the radio apparently exists, at least in theory. I had searched the Icom America website for it before I replied to your earlier comment. I didn't find it anywhere because the website has it miscategorized under "Land Mobile" and particularly because Icom's own search system finds NO mention of FRS anywhere on their website (despite the IC-4088A page which is there provided you already know the model number to look for).

Once I had the model number, I did find a few dealers who say they will sell you one (with prices from $121 to $151), but interestingly enough only one dealer who claims to have any in stock to actually sell.

Maybe I am just lucky but I have not found that to be the case.
I am in 752 yahoo groups.
I switch between neo and classic in firefox or use a second web browser.

One thing you can try is to go to your groups from the 'my groups' page
sometimes that works.
http://groups.yahoo.com/mygroups

Another trick is to access them via another server, such as
http://uk.groups.yahoo.com/mygroups
http://ca.groups.yahoo.com/mygroups

Again this is a temporary work around.
To buy more time until neo bugs and problems are fixed.

Looking at the back of the UV-5R 3800 mAh battery, there is an electrical plug contact at the top left side which the 1800 mAh doesn't have.

The contact is too small to accept the stock charger's DC input but is of similar shape, and I'm wondering what it's for, please. 12VDC power for charging from a cigarette lighter source? Battery eliminator?

All channel programming must be done from the top [A] VFO.

Use one of the guides on the Miklor.com/uv5r website

Also take a look at the "Reference for UV-5R Menus" which is available from the same website (look for Menu Detailed Reference on the UV-5R home page).

I had a problem with chirp and the cable. Install the cable software. When you go to set the serial port, name it PL2303 Cable. Install the pre-software that will allow Chirp to work. When you use chirp and is asks for the cable port, select the pL2303... It will have more than that, but it should work. I spent 2 to 3 weeks fighting it and I did that one thing for it to start working. Idk if it was installing the kext file or just that name change. Hope it works! Andre H KD2EQZ

Try going to the user guide listed at the bottom. Mmmm why do you have a simplex frequency and a tone? Tones are normally used in accessing a repeater which is duplex. You have to enter both a receive and transmit frequency separately and save it to the same memory channel (which has to be empty) If using a simplex frequency, both the Rx and Tx frequency would be the same

After a few failed attempts of fixing my ciggi lighter eliminator...I'm trying to figure out what voltage regulator to replace the old one inside the battery moudule that houses the circuit board.

Seems I need a regulator to output 7.5 vdc but at what current rating? I'm guessing 500 ma at least. 4 watts x 7.5 volts =.533 amps... Any suggestions? Also how the Frick does one search the conversations for answers, since Yahoo messed around with the groups software? This new group software is as bad as the newly release Yahoo email!

Thanks
John

Thanks. Yeah, no specification of amperage output and a too-short coiled cord. I can't see an advantage over using the regular charger with the 300W AC inverter and 3 AC outlets, but as you say, it's cheap enough to have one if it ever becomes needed.

The barrel jack is in parallel with the charging tabs on the back that are used for the charging cradle. So you can charge the battery using this port but source would need to put out 8.4 volts and have the same charging 'smarts' as the charging cradle.

Another use for the port would be to power some other device that required 7.4 volts.

All of our channels at work (repeater and simplex) were setup by our radio dealer to use CTCSS. I don't think that this is unusual for business (part 90) use. So I have to program TX CTCSS tones for all of those channels or none of the other radios would be able to 'hear' me. I leave the RX CTCSS tone set to OFF because I want to hear any transmissions that occur on the frequencies that were assigned to us.

Some of the newer 3800 mAh batteries, for the UV-5RE and others, do not have this socket in the case. I have two similar to: http://www.ebay.com/itm/261165307806, and there is no way to use a 2.5 mm charger plug.

4 Watts is the RF energy output, not the UV-5R's consumption. Everything in the radio consumes (or wastes) energy. 500mA input might let you receive, but not transmit. I don't know what the right figure would be, but it will be well in excess of half an Amp.

And yes, Yahoo's Neo has rendered Yahoo Groups next to useless, and is crippling Mail next. Yahoo is shooting itself in both feet.

I would think that Part 90 radio systems not using both TX/RX tones would be the exception. Most users are not into radios as we are. The delivery guy for Harold's Market doesn't want to hear where Bob's Towing Service is being dispatched to pick up a vehicle. Yes, they are supposed to share the frequency and should hear each other when they take the mic off hook but I'd be willing to wager most have off hook monitoring disabled.

Most modern Part 90 radios don't even have the "off hook monitoring" capability.

Even for very old radios that did have this feature, it rarely works today because it was normally based on having the metal button on the back of the microphone grounded for 'on hook' (CTCSS working) and just removing the ground connection for 'off hook' (CTCSS defeated). That worked great in the days when vehicles had a metal dashboard, but became almost useless when everything turned to plastic. I can remember having to run a ground wire to the screw on the metal mic bracket to make this function work; but it has been a long time since I saw a radio with this function even available, much less enabled.

make sure you add it to an "open" channel and also go back and set it to the same channel for transmit too. You'll know a channel is not in use if there is no "CH-" in front of the number.

Dual VFO's - one frequency for VFO A and another for VFO B. To use the CB analogy, VFO A could be listening on Channel 9 and VFO B could be listening on Channel 23. For some folks, doing two things at once is too confusing, so they set both VFO A and B to the same frequency.

Two points:

1) You'll find that people are more inclined to listen to you when you leave the childish insults in your own head, and when you stop yelling.

2) You'll find better learning by following the thread, rather than responding to your misunderstanding of any single post. We're talking FRS/GMRS utility on the Baofeng UV-5R here, and the legality thereof, especially on shared FRS/GMRS frequencies. GMRS transmission is only legal with the stated FCC license.

Take a nap, will ya please?

As Craig said, it's mostly for listening to 2 freqs at once. The hand set will jump (if the option is turned on) to the one that had the most recent traffic.

I don't know how how other people are using the bands, but I like to use A to listen to 2 meter, and B to listen on 440. In channel mode, I use it to listen to the 2 different repeaters I like.

Chris
KD8VPJ

---In baofeng_uv5r@yahoogroups.com, <craig.n7lb@...> wrote:

Dual VFO's - one frequency for VFO A and another for VFO B. To use the CB analogy, VFO A could be listening on Channel 9 and VFO B could be listening on Channel 23. For some folks, doing two things at once is too confusing, so they set both VFO A and B to the same frequency.

I suppose "best" is subjective, but I'd like to buy a clip-on speaker mic for the UV-5R that provides good, clear Rx audio, and good, clear Tx even in the presence of background sounds.

I've looked at several offerings on http://www.amazon.com/s/?_encoding=UTF8&camp=1789&creative=390957&field-keywords=baofeng%20speaker%20mic but am hoping to hear with those who have a speaker mic with their UV-5R variant and are pleased enough with it to recommend it, especially if those on the other side of the conversation have remarked positively on the Tx quality.

My ham radio friend just received his new Baofeng UV5R through a Amazon supplier, based on my recommendation. We were displeased to discover that the internal mic does not work! When we used my optional speaker-mic, we had audio. We used compressed air at this speaker-mic jack with no result. We were very reluctant to attempt to drill out the small mic hole in the front. He is now in the process on returning it to the supplier for a replacement. 73, Karl

From: kd2eqz@...

> I have a problem. My UV-5R isnt transmitting audio
> with the mic on the body of the radio. It only transmits
> with the earpiece, I need help with this!

Three possible problems:

1. The hole in the case where the mic is located is not open. This is rare by has been known to happen. If this is the problem you would not have any transmit audio using the internal mic -- and the problem would have been that way right from the start.

2. The mic could be bad or its connection might be bad. These are extremely rare, but have been known to happen. Possibly the mic has died or the solder joint wasn't well soldered and has come open. If it is just the solder joint bad, you might be able to fix it with a fine tip soldering iron and a very steady hand.

or

3. The mic connector on the side of the radio might not be closing the connection when you unplug the headset or programming cable. This is not really very common, but it is more common than either of the other two possibilities. The Mic and Earphone connectors are both designed to disconnect their respective circuits when something is plugged into the jack. That circuit should reconnect itself when the plug is removed from the jack BUT SOMETIMES IT DOES NOT CLOSE THE CIRCUIT. You can try banging the radio against your hand to try to jar the connection closed or you can try blowing canned air into the mic jack. If those don't work, you can buy a replacement jack and install it (again, you need a fine tip soldering iron and steady hands) -- or you can just use the headset or a speaker/mic.

Bottom line: If the radio is new, talk to the seller about sending it back as defective. If the radio is not new, it may be possible to fix it, but it is far easier to work around the problem.

Karl,

Before drilling the mic hole bigger, I recommend sticking the end of a metal paper clip in the mic hole. It is nearly the perfect size and doing this will make sure the internal end of the hole isn't partially or fully closed.

Someone mentioned about a year ago that you could use the backlight to see if the mic hole was open on the inside of the case or not. I tried this suggestion and it does work. What you do is go in a dark room with the radio and press a key to get the backlight to come on. If you look in the mic hole at just the right angle, you can see light through the mic hole.

Returning the radio sounds like the right thing to do.

C'mon Gary, do you really expect a $8.00 mic on a $30 radio to sound as
good as a Kenwood? There's a reason these things are so cheap.

The mic Jim purchased is the type I use 99% of the time. Volume can be adjusted so that you can hear without any issues. If noise is a real issue, use an earphone that plugs into the jack on the mic or even better might be replacing the speaker mic with single or dual muff headphone.

What a waste of having a dual monitor radio. If you only want to listen to 1channel, fine, but this gives you the opportunity to monitor 2channels at the same time, whether they be on vhf, uhf, or both. Once you get used to using the radio, you won't have to set it up with name on one, freq on the other. One the freqs I use all the time, I name the channel with the freq numbers. On freqs I don't use very often, I use a descriptive name like a city, the call sign, or the hill it's on. It is easy enough to switch from name to freq for as seldom as you would need the info. Just my opinion.

If you know the Location, Call, or Club that operates the repeater, in other words, the A line identifies the repeater, why do you need to know the frequency if it is programmed into the UV-5R?

Personally, I find no desire to use the dual receive feature and have it disabled. If I want to listen to two different frequencies at the same time, I'll turn on another radio. I always have several charged and always take extra radios to events. If the feature is important to you, great, but not all of us find it that beneficial.

Actually, zippy, neither 95.3 nor 95.135 has anything to do with whether or not people need a license to use the â☐☐FRS/GMRSâ☐☐ radios on channels 1-7. The critical regulation is 95.639(d) combined with 95.603(d) and 95.194

Any radio that is CAPABLE of more than 0.5W ERP cannot be certified for FRS. The so-called "FRS/GMRS" combination radios have to be internally limited to 0.5W or less on the FRS frequencies but they can have higher output on the GMRS channels. On the standard 22-channel "FRS/GMRS" radios, channels 15-22 are pure GMRS channels, channels 8-14 are pure FRS channels (the 467.xxxx MHz FRS frequencies) and channels 1-7 are the GMRS Interstitial channels which are the same frequencies as the 462.xxxx MHz FRS frequencies. The manufacturers of these radios take advantage of the fact that these channels are authorized GMRS frequencies so they can set them for the full output power of the radio. Since most users start out using these radios on these channels the customers get more range because the radio is putting out 1 to 2 Watts (or more in some cases).

Look up the certification of these FRS/GMRS radios, you will find them certified for GMRS on all the 462.xxxx MHz GMRS Frequencies but certified for FRS only on the 467.xxxx MHz frequencies (which are channels 8-14)

What a waste of having a dual monitor radio. If you only want to listen to 1channel, fine, but this gives you the opportunity to monitor 2channels at the same time, whether they be on vhf, uhf, or both. Once you get used to using the radio, you won't have to set it up with name on one, freq on the other. One the freqs I use all the time, I name the channel with the freq numbers. On freqs I don't use very often, I use a descriptive name like a city, the call sign, or the hill it's on. It is easy enough to switch from name to freq for as seldom as you would need the info. Just my opinion.

I'm new to this as many are.. but I'm having a hard time finding out what the bottom "B band" frequency number on our lcd display used for on our radios? I can't seem to figure it out at all in the manual or online anywhere. Is it related to repeaters? I guess I don't really understand what its real world application is used for or its significance. Any insight?

4 Watts is the RF
energy output, not the UV-5R's consumption.
 Everything in the radio consumes (or wastes) energy.
 500mA input might let you receive, but
not transmit. I don't know what the right figure
would be, but it will be well in excess of half an
Amp.
And yes,
Yahoo's Neo has rendered Yahoo Groups next to useless,
and is
crippling Mail next. Yahoo is shooting itself in both
feet.

Jim, or anyone else who has the Kenwood mic mentioned.....

In reading the reviews on the DX site, I came across this comment>

"

Cons: It does not have a 3.5mm jack, but you can use a 2.5-3.5mm jack transferer."

are both input pins the correct size for the radio????

Or is the person referring to the earpiece jack on the mic????

also, someone mentioned that volume can be adjusted st the mic.....I did not see that on the sellers page

Tnx

On Thursday, October 17, 2013 9:05 PM, Gary <n9ptc@...> wrote:

The mic Jim purchased is the type I use 99% of the time. Volume can be adjusted so that you can hear without any issues. If noise is a real issue, use an earphone that plugs into the jack on the mic or even better might be replacing the speaker mic with single or dual muff headphone.

If you ordered this charging cable BE CAREFUL. I sent a question to the seller and here is their reply:

Dear sworldwideseller,

What are the specifications on this charger? Input voltage range? Output Voltage range? Is the output voltage regulated? Is there a Li-Ion charging circuit built into this charging cable?

- threeoldcrows

Dear threeoldcrows,

dear, the charger specifications is K4 line filling or 1.1 the head line filling. Output Voltage is 12V.
the cable is made of copper core.output voltage is no change.
have a nice time
Amiee

- sworldwideseller

Basically this means if you plug this charger into your cigarette lighter receptacle and into a 3600/3800mAh battery, you will be sending anywhere from 12 v to 14 v directly into a 7.4v Li-Ion battery. If you have read anything about Li-Ion batteries and the charging of Li-Ion batteries this could be very dangerous. Sending this type of voltage directly into that battery could result in explosion and fire, and if you are travelling down the road when the battery, laying on the car seat beside you erupts into a flaming mass it could be hazardous to your health!

It's for a charger.

Somebody posted this link before - don't see any feedback on how well it works but the price is right.

http://www.ebay.com/itm/New-2-5mm-Car-Charger-Cable-for-BAOFENG-UV-5R-3800mAh-battery-BL-5L-/181176343056?pt=US_Radio_Comm_Device_Batteries_Chargers <http://www.ebay.com/itm/New-2-5mm-Car-Charger-Cable-for-BAOFENG-UV-5R-3800mAh-battery-BL-5L-/181176343056?pt=US_Radio_Comm_Device_Batteries_Chargers&hash=item2a2ef39a10> &hash=item2a2ef39a10

Thanks. Yeah, no specification of amperage output and a too-short coiled cord. I can't see an advantage over using the regular charger with the 300W AC inverter and 3 AC outlets, but as you say, it's cheap enough to have one if it ever becomes needed.

Easy enough to search the archives – but you will probably need a larger screen than your phone to make it practical. Yahoo’s new format for groups does make it harder but once you log in to the group Yahoo page, you will see a box at the top of the screen that says “Search Conversations” – I recommend trying to hold down the search term to just a word or two if you can.

An alternative that often works better is to use Google – put the key words of your question in the search box followed by SITE:GROUPS.YAHOO.COM to limit the Google search to just Yahoo Groups. Depending on your search terms, you may get results from several other groups but it usually isn’t hard to run down the list of results to see the ones that look promising.

No you don’t need to justify your choices to him, or to anyone else; but the question remains legitimate.

It seems quite common for new users to have no idea why this radio has two displays, this results in numerous misconceptions and a large number of the questions that people ask here rather than read the documentation or bother scanning the message archives.

Nearly half the people who come here with problems manually programming the radio, only think they have a problem because the bottom display doesn’t change after they program a channel.

Then, of course, we get the dozens of new users who assume that the two displays ought to magically work together to display a name AND a frequency. Eventually people manage to explain to them that the only way to sync the two displays is to manually change the channel on the second display.

If asked why they want the name AND the frequency at the same time, these new users generally feel there is some reason that they ought to want to know the frequency they are listening to. What they seem to have a hard time recognizing is that you CANNOT listen to a channel on one display and simultaneously change the channel on the other display to sync with the channel you are listening to. Experienced users rarely feel this compulsion to see the little numbers representing the frequency of the Podunk Fire Department or the frequency of their local repeater – once an individual figures out a naming system that works for them, the urge to look at the pretty numbers tends to fade away.

There is nothing wrong with some people wanting to see the frequency – the radio can easily be set to show the frequency OR the name, the problem is that there is no easy way to make the radio show BOTH at the same time. An inordinate amount of the posts here are from people asking how to do this and other people trying to help them. When faced with yet another new user asking for help doing something that simply cannot be done with this radio, some of us try to suggest a better way to accomplish what the new user really wants rather than just describing complicated ways to do what he thought he was trying to do. Thus the question “WHY do you want to do that?” is really a legitimate question.

I'm new to this as many are.. but I'm having a hard time finding out what the bottom "B band" frequency number on our lcd display used for on our radios? I can't seem to figure it out at all in the manual or online anywhere. Is it related to repeaters? I guess I don't really understand what its real world application is used for or its significance. Any insight?

IDK, just convenient I guess. As another poster pointed out ,if they wanted to listen to another frequency, they would turn on another radio. I have 3 HT's 2 UV5r and a Yaesu FT60, so I could even listen to a 3rd frequency if I want to. And yes, I know the bottom frequency doesn't follow the top. Or another answer to the legitimate questions is : Becauase I can

Subject: Re: [baofeng_uv5r] Bottom Frequency on the UV5r

No you don’t need to justify your choices to him, or to anyone else; but the question remains legitimate.

It seems quite common for new users to have no idea why this radio has two displays, this results in numerous misconceptions and a large number of the questions that people ask here rather than read the documentation or bother scanning the message archives.

Nearly half the people who come here with problems manually programming the radio, only think they have a problem because the bottom display doesn’t change after they program a channel.

Then, of course, we get the dozens of new users who assume that the two displays ought to magically work together to display a name AND a frequency. Eventually people manage to explain to them that the only way to sync the two displays is to manually change the channel on the second display.

If asked why they want the name AND the frequency at the same time, these new users generally feel there is some reason that they ought to want to know the frequency they are listening to. What they seem to have a hard time recognizing is that you CANNOT listen to a channel on one display and simultaneously change the channel on the other display to sync with the channel you are listening to. Experienced users rarely feel this compulsion to see the little numbers representing the frequency of the Podunk Fire Department or the frequency of their local repeater – once an individual figures out a naming system that works for them, the urge to look at the pretty numbers tends to fade away.

There is nothing wrong with some people wanting to see the frequency – the radio can easily be set to show the frequency OR the name, the problem is that there is no easy way to make the radio show BOTH at the same time. An inordinate amount of the posts here are from people asking how to do this and other people trying to help them. When faced with yet another new user asking for help doing something that simply cannot be done with this radio, some of us try to suggest a better way to accomplish what the new user really wants rather than just describing complicated ways to do what he thought he was trying to do. Thus the question “WHY do you want to do that?” is really a legitimate question.

Hello guys, I just received my programming cable for my UV5RA.

I'm using chirp on linux, and it seemed to be working right at first but it has some very annoying behavior.

Here is how I programmed it. http://i.imgur.com/wW9Hyr8.png http://i.imgur.com/wW9Hyr8.png

I don't know why it says NFM instead of FM on the first one, I changed that and reprogrammed so that's not it.

Basically, in channel mode the names are separate from the frequencies, I have to change the name separately from the frequencies and vice versa, by hitting the A/B key.

Why would the name be separate from frequency? That behavior is very annoying. Is there a workaround or fix?

Thanks for your help guys,

Are you sure you changed it? When you click on the cell and then select FM, you must then click on some other cell to "set" the change. If you don't, the selection won't "stick" and the original setting will be uploaded to the radio or saved to the image file. A quick way to make sure a change is "set" properly is to press the [Go] button near the top left of the spreadsheet memory editor. If the setting reverts back, then it wasn't properly selected.

The top [A] line and bottom [B] line are both independent from each other. The only way that can be synchronized is manually by the user.

>
> Why would the name be separate from frequency? That behavior is very

Each line can have its Memory Display Format (MDF) set to CHannel, NAME or FREQuency. So NAME isn't separate from FREQuency. As stated above, [A] is separate from [B]. And they can just as easily be set to NAME/NAME, FREQ/FREQ, FREQ/NAME or one of the other 5 combinations.

The reviewer must be commenting about the auxiliary speaker jack. The Kenwood speaker mic naturally has a Kenwood style 2-pin plug that fits the speaker mic ports of Kenwood radios (and radios with Kenwood compatible ports like the UV-5R).

I'm assuming they are referring to the earphone jack on the mic. The mics I've used have always ad the 3.5mm jack but I know a 2.5mm is used with some. Both work, you just need to make sure you order the correct earphone for your mic.

Very few speaker mics have a volume control. It's normally just as easy to adjust it using the radios volume knob.

I agree that there are very few mic's that have a volume knob, but that function for me is mandatory! I use my Kenwood SMC-34 mic which does have an adjustable volume knob on the mic while hunting and my radio is in a watertight bag in my backpack. That way I can communicate with my hunting partner at will without having to touch my radio and when I run into animals, I turn the volume off so my partner won't spook the animals should he transmit at that time.

I did use this mic with my UV-5RE+ on my last trip and it worked just great.

The SMC-34 mic costs around $36+, so if anyone knows of a similar mic at a lower price, please post the info here.

  Something to consider. Kurt (at 3 Old Crows) has Acoustic Earpieces with Microphones.
http://threeoldcrows.com/shop/magento/acoustic-tube-ear-piece-with-mic.html
With the earpiece, there would be no need to adjust the volume. You would be able to hear him, but the critters wouldn’t.
Just a thought.

From: <tenorman1952@...>
Topic: 35536 Message: 35589

Sorry to the OP, didn't mean for my question to come off that way, but yes, it's your radio.

I did the same at first, but soon realized that knowing the frequency was not that important as compared to knowing where the repeater was. Am I close enough to use that repeater?

I have found much more utility to having both A and B displays set to NAME. Locally I keep the A display set to my local repeater, and the B line to our IRLP frequency. I can easily toggle back and forth with the blue A/B button. I keep Dual Watch disabled.

While traveling around the area I can bring up different repeaters on the A and B, and toggle back and forth as I get nearer other repeaters.

When there are times that I might need to know the frequency the keystrokes required to switch back and forth from NAME to FREQ are very easy and quick.

Menu
2 1 (for A line, or 2 2 for B line)
Menu
^ or v arrows until you have scrolled to FREQ
Menu
Exit

Now the A line will read Frequency.
To return to NAME press

Menu
2 1 (or 2 2)
Menu
^ or v to scroll to NAME
Menu
Exit

So you can still quickly access the frequency and still have the convenience of knowing the name or location.

One more thing you can do... program simplex frequencies as channels and name them. That way you don't have to memorize the exact simplex freq, but can still easily identify it. For the 2 meter simplex frequencies you know the first two digits are always 14. So, I name them like this:

SX (for simplex) and the last four digits. 146.520 becomes SX6520, the SX replacing 14. Looking at that I instantly know that SX - Simplex, and the freq is (14)6.520 mhz.

SX6400 for 146.400 mhz
SX6415 for 146.415 mhz
SX6430 for 146.430 mhz

etc.

For most repeaters I use an abbreviation of the town name, such as Morgan City's Repeater is MCRPTR. But when I am in Lafayette there are several of repeaters. I call them LAF1, LAF2, LAFSKY (for Skywarn).

LAF1 is 146.820. Had I programmed for just frequency there is a problem. The best repeater in New Orleans is also on 146.820. They have different tones, and are far enough apart there is no chance of interference, but if I only looked for 146.820 there is still the problem of two different tones that I can't immediately tell from the frequency. What is more important is that I know which is in Lafayette and which is in New Orleans.

Another way would be to use LF6820 and NO6820. The first two letters tell me which city, and the rest indicates the frequency.

An aside, I program Channel 000 on the UV-5R to 146.520, and name it NATCAL for National Calling Frequency.

My point is, there are easy workarounds to know the frequency, while still retaining the utility of knowing the location or other way to identify the repeater.

Subject: [baofeng_uv5r] Bottom Frequency on the UV5r

I'm new to this as many are.. but I'm having a hard time finding out what the bottom "B band" frequency number on our lcd display used for on our radios? I can't seem to figure it out at all in the manual or online anywhere. Is it related to repeaters? I guess I don't really understand what its real world application is used for or its significance. Any insight?

To add to John's answer, it is convenient to have the A and B displays and be able to toggle back and forth even when not using the dual watch feature.

For example, you might be reporting back to a team leader or headquarters on one freq or channel, and with a team around on on another. For example, the boat race we (club) work every year. I can set the A display to the race headquarters, which is linked via our local repeater. But I can talk to the member at the finish line, or other locations on a simplex frequency. Speaking to them does not interfere with my communications with race headquarters, and our talk among ourselves does not tie up the repeater with chatter headquarters does not need to hear or know. We simply toggle from A to B and back as needed.

Another use, I had programmed repeaters along the interstates on a long cross country trip. It was easy doing this with CHIRP after having saved my normal programming file. I overwrote most of the repeaters and simplex frequencies. I named the repeaters for the towns that I would pass through, in order. As I went through one town, I could simply use the up and down scrolling buttons to scroll up to the town I was in. Toggling from A to B, I would set that to the next town. And back and forth, I could toggle the A/B button as I drove along with minimal distraction. I spoke to a number of hams along the way.

Hello guys, I just received my programming cable for my UV5RA.

I'm using chirp on linux, and it seemed to be working right at first but it has some very annoying behavior.

Here is how I programmed it. http://i.imgur.com/wW9Hyr8.png http://i.imgur.com/wW9Hyr8.png

I don't know why it says NFM instead of FM on the first one, I changed that and reprogrammed so that's not it.

Basically, in channel mode the names are separate from the frequencies, I have to change the name separately from the frequencies and vice versa, by hitting the A/B key.

Why would the name be separate from frequency? That behavior is very annoying. Is there a workaround or fix?

Thanks for your help guys,

Gary,

I live in Washington State and yes, WDFW does allow two way radios and GPS while hunting. They discussed banning radios but that was not incorporated since radios are a big safety factor as are GPS devices. Now they have cell phones which are impossible to ban, so any advantage of using radios while hunting was dismissed by our WDFW.

Also the previous comments regarding using ear phones is not advisable for hunting. I have tried them in the past but they interfere with your hearing of the surrounding noises like a branch breaking or an animal vocalizing. The SMC-35 speaker mic seems to work best for us.....

While traveling around the area I can bring up different repeaters on the A and B, and toggle back and forth as I get nearer other repeaters.

As long as I know the frequency, I can do that now. I routinely travel a route and I have memorized the channels I need. VTW I use one of my radios as a mobile. I have it set up for my surrounding counties and the ones I travel to regularly in alphabetical order (by county)
So you can still quickly access the frequency and still have the convenience of knowing the name or location.

One more thing you can do... program simplex frequencies as channels and name them. That way you don't have to memorize the exact simplex freq, but can still easily identify it. For the 2 meter simplex frequencies you know the first two digits are always 14.

I do that now. I'm on a CERT team with a few other hams. We've picked a simplex frequency and called them CERT1 and CERT2. One on 2M , one on 70CM. My radio club just helped out with a race. I knew the simplex frequency before hand and gave it the name of the race.

For most repeaters I use an abbreviation of the town name, such as Morgan City's Repeater is MCRPTR. But when I am in Lafayette there are several of repeaters. I call them LAF1, LAF2, LAFSKY (for Skywarn).

I use either the name of the club that runs the repater (NOARS, NCARC) and if they run more than one the add a number (NCARC1). If I don't know the club I use the city and add a number.

An aside, I program Channel 000 on the UV-5R to 146.520, and name it NATCAL for National Calling Frequency.

Well then we are in agreement on one thing, I do too lol

☐
. Hey it's my radio and I can program it any way I want to and I don't need to justify my actions to anyone

And for Zaun's benefit, that's a legitimate answer to a legitimate question. Quite frankly, I don't care whether anyone has B set to dsiplay frequency, name, stock market ticker, tweets or whatever. It's your radio and you can program it any way you want. If why is all

some people have to worry about, you've got Waaaayyy yoo much free time on your hands and need to get a life. I'll get of my soapbox now.

Unless I've misread this thread, you'll still need to use the charging base to further regulate the voltage and control the actual charge. An unregulated ten volts is way too hot... even for the charging base. You will need a real low drop-out regulator in you cigarette lighter plug. The standard 7810 regulator has a 2 volt drop-out, it looses regulation if the in to out voltage drops below that value.

8.4 volts, or about, is what the battery's looking for as a charging voltage, and that only till its fully charged. It is then cut way back (by the electronics in the base) to keep the battery fresh for use.

Stan

Subject: Re: [baofeng_uv5r] 3800 mAh battery electrical plug

I guess you could make an adapter cable that the side charging cables would plug into one end at 12vdc in the cable you could drop the voltage down to the desired voltage needed to charge the battery.

I would not plug in while the car running though unless the modified cable has a small IC regulator unit to keep a decent regulation with a Zener control.

3 diodes @ 1amp with a fuse link would give a 2 volt drop to place the battery input voltage around 10 vdc, which would be the same as the charging base.

This might be a project to do as I have at least 20 of the side charging cords and 12 vdc sockets laying around. Just heat shrink and encapsulate the diodes or mount the small regulator board in a mini project case.

If you ordered this charging cable BE CAREFUL… I sent a question to the seller and here is their reply:

Dear sworldwideseller,

What are the specifications on this charger? Input voltage range? Output Voltage range? Is the output voltage regulated? Is there a Li-Ion charging circuit built into this charging cable?

- threeoldcrows

Dear threeoldcrows,

dear, the charger specifications is K4 line filling or 1.1 the head line filling. Output Voltage is 12V.
the cable is made of copper core.output voltage is no change.
have a nice time
Amiee

- sworldwideseller

Basically this means if you plug this charger into your cigarette lighter receptacle and into a 3600/3800mAh battery, you will be sending anywhere from 12 v to 14 v directly into a 7.4v Li-Ion battery. If you have read anything about Li-Ion batteries and the charging of Li-Ion batteries this could be very dangerous. Sending this type of voltage directly into that battery could result in explosion and fire, and if you are travelling down the road when the battery, laying on the car seat beside you erupts into a flaming mass it could be hazardous to your health!

Date: 2013-10-19 22:19:39 UTC
From: Akos Czermann
Topic: 35599 Message: 35599

I noticed that one model (UV5RE here: http://www.handyradio.co.uk/product/baofeng-uv-5re-plu-dual-band-136-174400-520mhz-radio-uv-5r-uv5r-copy/) seems to come with the UVB5's antenna.
The standard antenna being grooved at the bottom and this one looking like the UVB5's.
Any advantage of the UVB5 over the standard UV5R? I really like the look of the 5R and it is also Part 90 certified.
Also, any advantage of the new Plus models over the standard version? the price difference is an additional antenna. I know the hardware is the same operation-wise is it better to purchase the UVB5 over the 5R.

Your help is appreciated.

This worked for me, Accidentally, I discovered that in the address field aka URL where it says groups.yahoo. com/neo.. ..
1. if you write in the word STAGE. before the groups, as in stage.groups. yahoo.com/ neo
2. press ENTER, and
3. at least in my case, everything reverts back to the old Yahoo!

This is a temporary workaround for neo yahoo group problems.

I have both the UV-5R and the UV-B5. There is no question that the UV-B5
has better receiver selectivity than the UV-5R has. But in my opinion, I
would buy another UV-5R before I would by another UV-B5.

The UV-5R antenna is easily upgraded. I bought the UV-B5 antenna from an
eBay seller for less than $5.

I had a UV-B5 and found it not to me likings and returned it. Worked fine but has a smaller display that was hard on my old eyes. Along with a few other things that I didn't like so I ended up returning it. However I found that the antenna that came with it to be better than the UV-5R's. See my antenna test site at "www/dacomp.com/baofeng" (without the quotes).

I have the battery eliminator that is sold for the Baofeng, it is called, "Car Battery Adapter Eliminator for Baofeng UV-5R" in it's description and it has been working perfectly for me. I turn my radio on when I get up in the morning and off when I go to bed and all this time, it has been using this eliminator on a small 13.8vdc power supply. In my transmissions, abit, they are not really long ones, I notice no heating of this adapter.

Probably the best alternative to the so-called “battery eliminators” is to simply run the radio using the battery! The stock battery for the UV-5R lasts a surprisingly long time and the 3800 mAH battery lasts nearly three times as long (despite having only a little more than twice the capacity).

If you really really really need to run the radio forever from a 12v source, get the TYT charger (which will work up to about 14v) and use it to keep a second battery charged.

ALL the radios in the UV-5R family (which includes the F11) are identical internally.

ALL are equally "up to date."

The one thing that makes the F11 different is that it has slightly different firmware which makes it possible to disable the VFO/MR button. Disabling the VFO/MR button makes it possible to lock the radio into "Channel" mode which prevents the user from entering any frequency that was not already programmed into memory. This feature is needed to make the radio 100% compliant with US regulations for use outside the amateur radio service (but our FCC approved the regular UV-5R even without this feature).

I am not an expert on UK OFCOM regulations, but most European countries have strict regulations about the frequency coverage of radios and require that a radio be approved for use on whatever frequencies it covers. This is why the European versions of most amateur radios are limited to just the Region 1 amateur frequencies rather than the wider frequency coverage provided in the US versions of the same radio.

I suspect that all the UV-5R models fall outside UK OFCOM regulations due to the frequency coverage provided; and, of course the radio's 520 MHz coverage is far outside the Region 1 amateur frequencies so it is totally outside anything RSGB deals with as the United Kingdom's national society for amateur radio operators.

There have been reports of people having legal problems with the UV-5R, at least in Australia (which has very similar rules as those in the UK) but in some instances apparently having the radio programmed only for amateur radio frequencies and the operator having an amateur radio license were sufficient to resolve the problem (and in other instances they were not).

If you had an F11, programmed only for frequencies for which you hold a legal license, and with the VFO/MR button disabled to prevent access to any other frequencies, the radio might appear legal at least on casual examination.

That this is the label for radios sold in China. CMIIT is the the China Ministry of Industry and Information Technology. The first four numbers are the year of approval; the two letters are a code indicating the category of device; and the last four digits are the approval serial number issued by SRRC (State Radio Regulatory Committee)

This radio left the BaoFeng factory going to a dealer or wholesaler in China, or some other location where the Chinese approval label was used.

> type of FCC approved sticker on it.

That's not very surprising.

A lot of customers seem to have two misconceptions about Amazon.
1) They believe the are buying FROM Amazon
and
2) Because of 1) they believe the seller is in the US

Neither is always true.

The vast majority of items sold on Amazon are sold by various independent sellers who pay Amazon a fee for listing their product and an additional fee for each item sold. These sellers also agree to follow various rules that Amazon sets. In these regards buying on Amazon is not very different from a Buy-It-Now fixed-price listing on eBay.

Even the phrase "Fulfilled by Amazon" only indicates that the seller simply keeps items in stock in an Amazon warehouse where Amazon handles the packing and shipping - these sellers themselves are often located overseas and they use the "fulfilled by Amazon" program to provide faster delivery times.

The big advantage of dealing with Amazon is that the sellers have to agree to Amazon's return policies, which are generally much better than other online companies.

So, what does all this have to do with Part 90 Certification Labels??

All the UV-5R family of radios use the same circuitry and all are covered by the same FCC certification number. BaoFeng simply puts the circuit board into a different case with a different model number on the case. They also put different certification labels on each batch of radios based on where the radio is going when it leaves the factory. Radios being shipped to the US get the FCC Part 90 label; radios being shipped within China (including Hong Kong) get the SRCC (State Radio Regulation Center) approval label; etc. The problem is that many of the radios being sold to customers in the US were not ordered from the factory by a wholesaler in the US.

If someone buys a UV-5R from a seller in Hong Kong or elsewhere in China, they will get a radio with the SRCC label, not the FCC Part 90 label.

But simply buying from a seller located in the US does not guarantee getting the FCC Part 90 label. Radio dealers are usually small and many don't sell

enough of these radios to buy directly from the factory due to the minimum order requirements. Instead they buy from a wholesale company where they can buy smaller quantities of several different models. Most of those wholesale dealers are located overseas where they have lower costs. When BaoFeng builds a batch of radios, they label those radios based on where the radio is going as it leaves the factory. If that radio is going to a wholesale company in Hong Kong, it has to have the SRCC label to show the radio is approved for sale in China. If that wholesale company then sells the radio to a retail dealer in the US, the radio will still have the SRCC label, not an FCC Part 90 label.

If being legal for Part 90 is a concern, the buyer needs to check with the seller in advance to ensure that the radios will have the proper FCC Part 90 label and check the seller's return policy in case you receive a radio without the proper label. It is the same radio, regardless of the label, so the only issue is whether or not you need the radio to be legal for use on Part 90. Many people who plan to use these radios where they work will find that the employer insists on the Part 90 label because the employer will be fined by the FCC if the employee gets caught.

35624. Re: [baofeng_uv5r] No Part 90 Label

Xuan, that was a very clear and concise explanation re Part 90 labels.

I would like to add something and hopefully clarify even further.

As I understand it, the only people who need to be concerned about the presence or absence of the FCC label are the people who are using this radio as a Part 90 device.

If you are using it as an VHF/UHF device as a licensed AMATEUR in the AMATEUR BANDS, the Part 90 issue is moot.

The FCC does not certify or license amateur equipment (other than amplifiers; you can do a search under Part 97 at the FCC web site https://apps.fcc.gov/oetcf/eas/reports/GenericSearch.cfm?calledFromFrame=N and all you will see are 1000-1500 watt amplifiers) under Part 97.

Over the past days I have been exploring all of these and other comments, as well as the FCC site, and it is only now that I fully understand and appreciate the difference between Part 97 operation and all the others: for Part 97, the FCC licenses the OPERATOR and the operator is responsible for the proper operation of his equipment...for the other Parts such as 80, 90, and 95, the FCC licenses the EQUIPMENT (and as I understand it, there may be other licenses/permissions required for various operations, for example GMRS.)

So, as a licensed amateur I can use the UV-5R with or without a Part 90 label as long as I operate it on the proper frequency ranges allocated to amateur radio.

Thanks for the info.

I personally prefer the R5E Plus over the B5, as the antenna is the soul of the radio the question is decided, thanks for your input.
The radio might be used in a marine environment abouard ship for PMR446 and/or onboard channels, where the 5 watts will come handy - 0.5W will not get you through from the bowels of the ship.
The fact that I can program Marine channels in for emergency use sweetens the deal - contrary to popular belief you CAN use these radios for emergency communication. Part 80 cert or not :-)
Cheers,

Akos

If it is important for you to have an FCC part 90 sticker, then your best bet is to by from a USA dealer that promises that you will get one. Buying based on lowest price alone will improve your odds of not getting one.

That this is the label for radios sold in China. CMIIT is the the China Ministry of Industry and Information Technology. The first four numbers are the year of approval; the two letters are a code indicating the category of device; and the last four digits are the approval serial number issued by SRRC (State Radio Regulatory Committee) ...

Thank you for the decoding. Is it possible to also understand the second line, with "CE0678" with the encircled "!" and FCC logo? As in other logic, does that mean "not FCC"?

Yes, this will be fine for UK use; it is identical to the ones
you can buy over here. You would be better off getting one locally.

All current models will work up to 520MHz (if you get one that
doesn't, CHIRP will fix that). Be aware though that no Baofeng is
type-approved for any PMR use; the Ofcom website gives all the
details as to the requirements for particular bands.

Hi Junior,

Now that you have this fine radio you should visit the Miklor.com website.
Especially the New Owner User's Guide (if you monitor the group via email,
it is linked at the bottom of each email. See below).

USER GUIDE: www.miklor.com/uv5r/UserGuide
.
UV-5R FAQ: www.miklor.com/uv5r/FAQ
.

While you are there, look for Menu Detailed Reference. This will have links
to the "Reference for UV-5R Menus". Also you want a copy of the manual
created by the Chinese Radio Documentation Project (annotated) available
from the same website. See the pattern? A lot of your questions will be
answered at the Miklor.com website.

And now to answer your questions...

Power level:

In MR (channel) mode you can temporarily toggle the power level of the radio by tapping the [#] key (radios with BFB251 firmware and earlier require that TDR is set to OFF). An "L" in the upper status display indicated LOW power is selected and the absence of an "L" indicates that HIGH power is selected. Tapping any other key on the front of the radio will revert back to the setting that programmed into the currently selected channel.

The power level that is programmed into a memory channel (like most per-channel settings) can not be edited using the keypad. To "change" the setting, the memory channel must be erased and then reprogrammed from scratch. An alternative would be to edit the setting using software and then upload/write the change(s) to the radio.

Keypad lock:

The keys on the front of the radio can be locked by pressing and holding the [#] key until the keypad lock symbol (a key) appears in the upper status display. Pressing and holding the [#] key will exit the keypad lock. Note: The [CALL], [PTT] and [MONI] buttons are not locked.

Using the OEM or CHIRP software, the keypad lock can be set to automatically lock after about 9 seconds of inactivity.

73,
Jim KC9HI

You may as well stick a nail in your radio for as good as that small antenna is. It’s got terrible performance (i.e. size matters). It’s 20dB down on VHF from the lousy UV-5R “stock” antenna that everybody complains about.

And I got an answer from Nagoya on what their “real” antenna looks like…which has silver printing on it (attached).

So it’s my assumption now that all the blue imprint Nagoya’s are fakes.

In my testing the NA-771 with the silver print was 3dB better on VHF then the blue imprint and 5dB better on UHF.

John is going to post my test results on miklor soon…can only show so much in email due to limitations.

And the problem with mounting your mobile antenna anywhere but the center of your roof is that that you get a distorted radiation pattern.

However…given that here’s one possibility:

http://www.universal-radio.com/catalog/hamantm/5079.html -- this only works if you have an older vehicle since almost all newer vehicles have passivated glass.

Here’s a good tutorial on mobile antennas

Windshield mounts typically come with a box, stuck to the inside of the glass to “connect” to the outside antenna.
Usually have a Pl connector for the radio end and will require a cable adaptor to the radio, look on the Three Old Crows site for info on them.

They typically demand a good short connection from the box to vehicle metal. Have read of folks overlooking that with poor results.

The other issue, check the composition of the glass and of any coatings on it. Might not be able to get radio signals to pass through it.

Every "through the glass" antenna had compromise built into the design.
Larsen used to make them, but I haven't seen a dual-band model from them in
years. If you find one, expect that it will not perform as well as a
similar (non-glass mount) antenna, that's just the way they work.

A friend has one on their vehicle which seems to be sufficient for their needs. I took measurements of the antenna itself. If I can find it, I'll put it out there. Was a simple co-linear design with a six or seven turn open coil. Of course you'd have to engineer the match box. I'm trying to remember if I took a measurement on the mounting pad... probably not as I was a different use considered.

Subject: Re: [baofeng_uv5r] RE: windshield mount other aftermarket antennas

Every "through the glass" antenna had compromise built into the design. Larsen used to make them, but I haven't seen a dual-band model from them in years. If you find one, expect that it will not perform as well as a similar (non-glass mount) antenna, that's just the way they work.

On Mon, Oct 21, 2013 at 8:47 AM, Stan Labinsky Jr. <k2stn@...> wrote:

Windshield mounts typically come with a box, stuck to the inside of the glass to "connect" to the outside antenna.
Usually have a Pl connector for the radio end and will require a cable adaptor to the radio, look on the Three Old Crows site for info on them.

They typically demand a good short connection from the box to vehicle metal. Have read of folks overlooking that with poor results.

The other issue, check the composition of the glass and of any coatings on it. Might not be able to get radio signals to pass through it.

I have been looking into windsheild mounts too, lots on ebay but I cant confirm unsure what ones will connect directly without an adaptor.

I ordered a nice whip from aliexpress (lots of accessories on there for cheap):

http://www.aliexpress.com/snapshot/274420931.html

And a small antenna for portability:

http://www.aliexpress.com/snapshot/274420932.html

Any help on a window mount, I would be interested too?

OK, as promised, here are the dimensions of the dual band on glass antenna I mentioned:

Upper element 14”
Lower element 14”
Coil diameter (OD) 5/8”
Coil Length 2 and 5/16”
8 turns
All AWG 14, probably stainless with a black painted surface.

You’ll have to gin up the capacitor value of the thru-glass mount. Couldn’t tear open the match box.

35656. Re: [baofeng_uv5r] No Part 90 Label

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-21 16:51:07 UTC
From: Xaun Loc
Topic: 35599 Message: 35656

Exactly right, Ed. People using the UV-5R (or any other radio) exclusively in the ham bands have no need for the Part 90 label. Likewise people who use the radio to LISTEN (ONLY) on commercial and public service frequencies have no need for the Part 90 label. The label is only required if the radio is used to transmit on frequencies regulated under Part 90.

That is why I pointed out that IF someone needs the Part 90 label, they should be careful to check with the seller before buying the radio. Some sellers get their stock from several different wholesale companies, thus they may have some radio with the label and other identical radios without the label, so IF you need the label you should make sure that the seller says the radio you will get will have the label.

In some cases, the user may not personally care about the label but if they are going to use the radio on their employer's system, the employer is likely to care because the FCC will hold both the user and the employer responsible for any violation.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] No Part 90 Label

Xuan, that was a very clear and concise explanation re Part 90 labels.

I would like to add something and hopefully clarify even further.

As I understand it, the only people who need to be concerned about the presence or absence of the FCC label are the people who are using this radio as a Part 90 device.

If you are using it as an VHF/UHF device as a licensed AMATEUR in the AMATEUR BANDS, the Part 90 issue is moot.

The FCC does not certify or license amateur equipment (other than amplifiers; you can do a search under Part 97 at the FCC web site https://apps.fcc.gov/oetcf/eas/reports/GenericSearch.cfm?calledFromFrame=N and all you will see are 1000-1500 watt amplifiers) under Part 97.

Over the past days I have been exploring all of these and other comments, as well as the FCC site, and it is only now that I fully understand and appreciate the difference between Part 97 operation and all the others: for Part 97, the FCC licenses the OPERATOR and the operator is responsible for the proper operation of his equipment...for the other Parts such as 80, 90, and 95, the FCC licenses the EQUIPMENT (and as I understand it, there may be other licenses/permissions required for various operations, for example GMRS.)

So, as a licensed amateur I can use the UV-5R with or without a Part 90 label as long as I operate it on the proper frequency ranges allocated to amateur radio.

> type of FCC approved sticker on it.

That's not very surprising.

A lot of customers seem to have two misconceptions about Amazon.
1) They believe the are buying FROM Amazon
and
2) Because of 1) they believe the seller is in the US

Neither is always true.

The vast majority of items sold on Amazon are sold by various independent sellers who pay Amazon a fee for listing their product and an additional fee for each item sold. These sellers also agree to follow various rules that Amazon sets. In these regards buying on Amazon is not very different from a Buy-It-Now fixed-price listing on eBay.

Even the phrase "Fulfilled by Amazon" only indicates that the seller simply keeps items in stock in an Amazon warehouse where Amazon handles the packing and shipping - these sellers themselves are often located overseas and they use the "fulfilled by Amazon" program to provide faster delivery times.

The big advantage of dealing with Amazon is that the sellers have to agree to Amazon's return policies, which are generally much better than other online companies.

So, what does all this have to do with Part 90 Certification Labels??

All the UV-5R family of radios use the same circuitry and all are covered by the same FCC certification number. BaoFeng simply puts the circuit board into a different case with a different model number on the case. They also put different certification labels on each batch of radios based on where the radio is going when it leaves the factory. Radios being shipped to the US get the FCC Part 90 label; radios being shipped within China (including Hong Kong) get the SRCC (State Radio Regulation Center) approval label; etc. The problem is that many of the radios being sold to customers in the US were not ordered from the factory by a wholesaler in the US.

If someone buys a UV-5R from a seller in Hong Kong or elsewhere in China, they will get a radio with the SRCC label, not the FCC Part 90 label.

But simply buying from a seller located in the US does not guarantee getting the FCC Part 90 label. Radio dealers are usually small and many don't sell enough of these radios to buy directly from the factory due to the minimum order requirements. Instead they buy from a wholesale company where they

can buy smaller quantities of several different models. Most of those wholesale dealers are located overseas where they have lower costs. When BaoFeng builds a batch of radios, they label those radios based on where the radio is going as it leaves the factory. If that radio is going to a wholesale company in Hong Kong, it has to have the SRCC label to show the radio is approved for sale in China. If that wholesale company then sells the radio to a retail dealer in the US, the radio will still have the SRCC label, not an FCC Part 90 label.

If being legal for Part 90 is a concern, the buyer needs to check with the seller in advance to ensure that the radios will have the proper FCC Part 90 label and check the seller's return policy in case you receive a radio without the proper label. It is the same radio, regardless of the label, so the only issue is whether or not you need the radio to be legal for use on Part 90. Many people who plan to use these radios where they work will find that the employer insists on the Part 90 label because the employer will be fined by the FCC if the employee gets caught.

35657. Re: [baofeng_uv5r] FCC Logo on the label.

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)

From: Xaun Loc
Topic: 35599 Message: 35657

The FCC logo, by itself, indicates Part 15 compliance – which indicates that the radio does not exceed the RF limits for an UNINTENTIONAL radiator. That has nothing to do with the RF output signal that the radio puts out when transmitting; it refers only to the RF that escapes from the radio while it is receiving. Virtually all radios emit some amount of RF while receiving, especially newer radios which are basically computers, due to the oscillator and clock circuitry.

CE 0678 is a European certificate of conformity, R&TTE (Radiocommunications and Telecommunications Terminal Equipment) Directive, established in 2000 that covers radio equipment including tv's mobile phones etc

That this is the label for radios sold in China. CMIIT is the the China Ministry of Industry and Information Technology. The first four numbers are the year of approval; the two letters are a code indicating the category of device; and the last four digits are the approval serial number issued by SRRC (State Radio Regulatory Committee) ...

Thank you for the decoding. Is it possible to also understand the second line, with "CE0678" with the encircled "!" and FCC logo? As in other logic, does that mean "not FCC"?

35658. Re: [baofeng_uv5r] FCC Part 90 test for UV5R- info [1 Attachment]

Note that “the FCC” did NOT do any of this testing. All the testing, like all the other information about the radio on the FCC website, is simply what BaoFeng provided.

The FCC has not had its own lab in many years. All testing is done by supposedly “independent” labs which are hired and paid for by the applicant (normally the manufacturer of the radio). These labs are about as “independent” as the doctors who run drug research trials for the big pharmaceutical companies – the labs exist only because the radio manufacturers pay them to get good results. I am not accusing any of these labs of being dishonest – but the labs do work with the manufacturers to get the results that the manufacturers want; and, of course, bad test results never get released to anyone outside the manufacturer.

Even with my lack of deep trust in these “independent” labs, the test data from the labs is a lot more honest than the rest of the data provided by some manufacturers. For example, BaoFeng informed the FCC that the UV-5R meets all requirements for Part 90 certification, including not being field programmable (which we all know was not true of the original UV-5R or any of the related models other than the later version of the F11).

BaoFeng is hardly the only manufacturer shading the truth in its certification applications – I have a Wouxun that is also Part 90 certified and equally questionable.

It is illegal for the company to provide the label separate from the radio itself, but some manufacturers have been known to make them available to their dealers as ‘replacement parts’ in cases when the label on a radio is damaged. They would need to contact the manufacturer of their radio to see if there is any way to replace a damaged label.

From: R Pryor MAEd CETsr

Does anyone have a good source of Part 90 stickers?

Not that I am going to use this on Part 90 frequencies, however I have had people ask me about where they could get these stickers in the Search and Rescue groups.

I got a note from one of the U.S. distributors and we determined we were communicating with the same sales representative from Nagoya.

That U.S. distributor is ordering direct from the factory and gets blue lettered ones. Meanwhile the same sales rep sends me a picture of silver lettering and says that's the "company product".

So I don't know what the heck is going on. Hopefully we can get this cleared up.

Subject: RE: [baofeng_uv5r] RE: windshield mount other aftermarket antennas [1 Attachment]

You may as well stick a nail in your radio for as good as that small antenna is. It's got terrible performance (i.e. size matters). It's 20dB down on VHF from the lousy UV-5R "stock" antenna that everybody complains about.

And I got an answer from Nagoya on what their "real" antenna looks like…which has silver printing on it (attached).

So it's my assumption now that all the blue imprint Nagoya's are fakes.

In my testing the NA-771 with the silver print was 3dB better on VHF then the blue imprint and 5dB better on UHF.

John is going to post my test results on miklor soon…can only show so much in email due to limitations.

And the problem with mounting your mobile antenna anywhere but the center of your roof is that that you get a distorted radiation pattern.

However…given that here's one possibility:

http://www.universal-radio.com/catalog/hamantm/5079.html -- this only works if you have an older vehicle since almost all newer vehicles have passivated glass.

Here’s a good tutorial on mobile antennas

Yes, this will be fine for UK use; it is identical to the ones
you can buy over here. You would be better off getting one locally.

All current models will work up to 520MHz (if you get one that
doesn't, CHIRP will fix that). Be aware though that no Baofeng is
type-approved for any PMR use; the Ofcom website gives all the
details as to the requirements for particular bands.

Not by itself. You can get a repeater controller (about $95) and another radio (a total of 2 needed) (UHF only for about $24) to make a crossband repeater. The Baofeng UV-5R (and most handhelds) however are a poor choice for the transmit side of a repeater because they quickly heat up while transmitting.
The Baofeng UV-5R however does work as a crossband handheld for use with a crossband repeater. Some of the other low cost handhelds do not.

I got my uv5r recently with DHL express to Australia, it only took about a week from Hong Kong. It was marked as a radio and had no problems.

---In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

I was tipped off about this a few weeks ago. DHL and other carriers have dropped sending radios because they have Li-on batteries in them. The sellers could get past this ban by shipping small packages or hiding the batteries. it seems no more, we were told the battery prices will be going up and shipments might only come with radios and no battery and have the batteries shipped separately via Ocean Freight. ‘

UPS was still carrying batteries but placed a Hazmat charge on them running up the shipping prices, also Customs in this area is taking shipments and only releasing them to brokerage companies (after paying fees and having delays)

What this means to the average Uv5R user? get extra batteries now, including the ext 3800’s before the prices jump up due to shipping, shortages and extra hazmat fees.

Items with lithium batteries such as video cameras, walkie talkies/2-way radios, GPS devices, radio-controlled toys, Bluetooth headsets, smartphones/mobiles, laptop computers, shavers, power drills, tablets and portable DVD players - See more at: http://announcements.ebay.com/2013/09/changes-to-hong-kong-mail-regulations-may-cause-delayed-shipments/#sthash.i5Sreawz.dpuf http://announcements.ebay.com/2013/09/changes-to-hong-kong-mail-regulations-may-cause-delayed-shipments/#sthash.i5Sreawz.dpuf

Also some of the government HK policies of offering free postal services for export companies under PRC special economic zones also might be changed, this means you will not get free shipping anymore when you order a $30 UV5R. Not sure what scale they will be using but some type of charge will be levied.

Enjoy your new toys before they decide to ban these too and provide only a radio version that has one Government Obama channel and MSNBC.

Subject: Re: [baofeng_uv5r] RE: Shipping times from China

It seems small shipments are making it through. Large orders of radios (going to the US West coast) are not being carried by DHL, only UPS (per company) and Customs is starting to play games with brokerage fees.

You can so program the UV-5R with a VHF transmit freq and a UHF receive freq.
So, you can access your cross-band mobile radio with it. The HT will not RX and TX
at the same time.

That's not very surprising.

A lot of customers seem to have two misconceptions about Amazon.
1) They believe the are buying FROM Amazon
and
2) Because of 1) they believe the seller is in the US

Neither is always true.

The vast majority of items sold on Amazon are sold by various independent sellers who pay Amazon a fee for listing their product and an additional fee for each item sold. These sellers also agree to follow various rules that Amazon sets. In these regards buying on Amazon is not very different from a Buy-It-Now fixed-price listing on eBay.

Even the phrase "Fulfilled by Amazon" only indicates that the seller simply keeps items in stock in an Amazon warehouse where Amazon handles the packing and shipping - these sellers themselves are often located overseas and they use the "fulfilled by Amazon" program to provide faster delivery times.

The big advantage of dealing with Amazon is that the sellers have to agree to Amazon's return policies, which are generally much better than other online companies.

So, what does all this have to do with Part 90 Certification Labels??

All the UV-5R family of radios use the same circuitry and all are covered by the same FCC certification number. BaoFeng simply puts the circuit board into a different case with a different model number on the case. They also put different certification labels on each batch of radios based on where the radio is going when it leaves the factory. Radios being shipped to the US get the FCC Part 90 label; radios being shipped within China (including Hong Kong) get the SRCC (State Radio Regulation Center) approval label; etc. The problem is that many of the radios being sold to customers in the US were not ordered from the factory by a wholesaler in the US.

If someone buys a UV-5R from a seller in Hong Kong or elsewhere in China, they will get a radio with the SRCC label, not the FCC Part 90 label.

But simply buying from a seller located in the US does not guarantee getting the FCC Part 90 label. Radio dealers are usually small and many don't sell enough of these radios to buy directly from the factory due to the minimum order requirements. Instead they buy from a wholesale company where they can buy smaller quantities of several different models. Most of those wholesale dealers are located overseas where they have lower costs. When BaoFeng builds a batch of radios, they label those radios based on where the radio is going as it leaves the factory. If that radio is going to a wholesale company in Hong Kong, it has to have the SRCC label to show the radio is approved for sale in China. If that wholesale company then sells the radio to a retail dealer in the US, the radio will still have the SRCC label, not an FCC Part 90 label.

If being legal for Part 90 is a concern, the buyer needs to check with the seller in advance to ensure that the radios will have the proper FCC Part 90 label and check the seller's return policy in case you receive a radio without the proper label. It is the same radio, regardless of the label, so the only issue is whether or not you need the radio to be legal for use on Part 90. Many people who plan to use these radios where they work will find that the employer insists on the Part 90 label because the employer will be fined by the FCC if the employee gets caught.

Great info...

Could you tell us which specific Arrow antenna you bought??

Also, WRT the cable source, did you read the reviews?? it appears that there is a bait and switch going on there......

Tony

On Tuesday, October 22, 2013 12:07 AM, R Pryor MAEd CETsr <doopsnoop@...> wrote:

Here is the picture of it all assembled, will mount it later waiting for
some LMR400 with N type connectors to use with this antenna. Since I will
be mounting this up pretty high cable attenuation loss is a concern, especially
at UHF frequencies.

N type connectors are recommended instead of the common PL259 types, the
arrow antenna comes with a N type connector for this reason.

For those doing the same thing here is good cable source

http://www.amazon.com/LMR-400-Ultra-Cable-Connector-Black/dp/B0013REMTE/ref=sr_1_8?s=electronics&ie=UTF8&qid=1382414184&sr=1-8

I also have an Arrow antenna. Mine is their Open Stub J Pole model
OSJ 146/440. This antenna works very well with my UV-5RB. I have it mounted
outdoors at about 15 feet. It needs to be higher. I think the Arrow Antenna is
very well built and for $39, it's hard to beat. The SWR of this antenna is very
low across both bands and that is extremely important when you only have 4-5
watts to work with. Here is the link for the Arrow OSJ 146/440
antenna:
 http://arrowantennas.com/osj/j-pole.html

That's not very surprising.

A lot of customers seem to have two misconceptions about Amazon.
1) They believe the are buying FROM Amazon
and
2) Because of 1) they believe the seller is in the US

Neither is always true.

The vast majority of items sold on Amazon are sold by various independent sellers who pay Amazon a fee for listing their product and an additional fee for each item sold. These sellers also agree to follow various rules that Amazon sets. In these regards buying on Amazon is not very different from a Buy-It-Now fixed-price listing on eBay.

Even the phrase "Fulfilled by Amazon" only indicates that the seller simply keeps items in stock in an Amazon warehouse where Amazon handles the packing and shipping - these sellers themselves are often located overseas and they use the "fulfilled by Amazon" program to provide faster delivery times.

The big advantage of dealing with Amazon is that the sellers have to agree to Amazon's return policies, which are generally much better than other online companies.

So, what does all this have to do with Part 90 Certification Labels??

All the UV-5R family of radios use the same circuitry and all are covered by the same FCC certification number. BaoFeng simply puts the circuit board into a different case with a different model number on the case. They also put different certification labels on each batch of radios based on where the radio is going when it leaves the factory. Radios being shipped to the US get the FCC Part 90 label; radios being shipped within China (including Hong Kong) get the SRCC (State Radio Regulation Center) approval label; etc. The problem is that many of the radios being sold to customers in the US were not ordered from the factory by a wholesaler in the US.

If someone buys a UV-5R from a seller in Hong Kong or elsewhere in China, they will get a radio with the SRCC label, not the FCC Part 90 label.

But simply buying from a seller located in the US does not guarantee getting the FCC Part 90 label. Radio dealers are usually small and many don't sell enough of these radios to buy directly from the factory due to the minimum order requirements. Instead they buy from a wholesale company where they can buy smaller quantities of several different models. Most of those wholesale dealers are located overseas where they have lower costs. When BaoFeng builds a batch of radios, they label those radios based on where the radio is going as it leaves the factory. If that radio is going to a wholesale company in Hong Kong, it has to have the SRCC label to show the radio is approved for sale in China. If that wholesale company then sells the radio to a retail dealer in the US, the radio will still have the SRCC label, not an FCC Part 90 label.

If being legal for Part 90 is a concern, the buyer needs to check with the seller in advance to ensure that the radios will have the proper FCC Part 90 label and check the seller's return policy in case you receive a radio without the proper label. It is the same radio, regardless of the label, so the only issue is whether or not you need the radio to be legal for use on Part 90. Many people who plan to use these radios where they work will find that the employer insists on the Part 90 label because the employer will be fined by the FCC if the employee gets caught.

35689. Brisbane Repeaters

This looks like a pretty comprehensive list:
<http://www.vkham.com/Repeater/brisbane.html>

By the way, the <2m> labels should be changed to <2 m> and the <70cm> label should read <70 cm>.

For a review of proper use of the International System of Units (SI) in Australia, see: <http://www.measurement.gov.au/measurementsystem/Pages/HowAustraliasMeasurementSystemWorks.aspx> and then click on International System of Units.

Good luck with those repeaters!

Additional suggestion...I just spoke with the Arrow Antenna people in Wyoming and they said it is perfectly fine to drill a hole in the long vertical element and hang it with a non-conducting rope.

This would probably give you a lot more height than a mast...IF you have trees in your back yard (or on the hill top in the state park)

Am waiting to hear the performance report.

Regards,

Ed

I have same problem, I just ordered a new cord with cd, and hopefully that works. My probelm is that driver downloads, no yellow sign tell me any issues, connect up pc to radio, bring up the software program, and will not read or write to radio, and yes comm port is correct...So I think i got a fake chipset and hopfully new cord will work...

My big question will the chirp software work with my orginial cord?

Of course hanging the antenna with anything non-conductive won't affect it - but be careful that you don't end up with the antenna at a slant off center. You might consider drilling one small hole a few inches below the top one and wrapping the string around the top tube (helping the antenna stay as straight as possible in the air). A few degrees off won't matter much, but if you hang this thing at a 20 percent angle (or worse), it will mess up your pattern.

Craig

35698. Understanding the FRS issue

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-22 23:51:15 UTC
From: Jeff Mertz
Topic: 35698 Message: 35698

I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

The question is, help me understand why it makes a diffeence that FRS radios should not be more than 1/2 watt, why do the antennas have to be permanent. I am a why person, and I understand I can't use my radio on a FRS frequency, but I don't understand why. Helping people understand the why's makes me a more informed user of any technology.

And if this has been covered before4...and I am sure it has, that is OK, there were 116 new users in the last 7 days...for a reason.

Thanks for your input...but make sure it is not broadcast at more than 1/2 watt...

Hello All,

Just received one of these cords sold by "Sworldsales." The unit blew it's 8 amp fuse as it was plugged into the battery. Upon taking the charger apart, it was found that the voltage regulator, a 22 ohm 1 watt resistor had been completely bypassed. The full voltage from the car was connected directly across the Li-on battery. I am lucky that the battery did not blow up.

The simple fact is that this particular service (FRS) is intended for SHORT range communications. The equipment was engineered with that intent.

Half a watt max and a fixed antenna... no “J”poles in a tree, no Nagoya 771s with tiger tails to push the limits.

And, in order to maintain that intended use, laws were put into place, manufacturers were informed, you want to sell these radios, this is how they will be.

Don’t like it... tuf! ‘sway it is.

35706. Black BL-5L batteries

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-10-23 01:30:14 UTC
From: cougercat
Topic: 35706 Message: 35706

Hello All,

Just received a couple of these which were sold on E-pay. Since the batteries were going to be used for another purpose, the black battery case was removed. Inside, there were 2 Li-on cells. Each cell was marked "SR5043100P 2600mah." According to my Maha C777Plus battery analyzer, the cells are measuring a discharge current of 2457 mah during a 7 hour discharge from fully charged (8.6 volts) down to 6.5vdc. The battery is now going thru it's 4th charge discharge cycle now and the numbers haven't changed much. According to the battery label, these were suppose have a capacity of 3800mah at 7.4vdc.

My question is: Where are the battery manufactures getting the extra 1300 mah?

>>I am curious as to the reasons the UV5r is not legal to use on the FRS frequencies. I understand it has to have a permanent antenna, it can't output more than 1/2 watt, it is not blah blah blah...

I'm not an FCC lawyer, nor do I play one on TV, but.

I believe the FRS was conceived as a local, "keep in touch with friends", non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We'll never hear each other, and so we can share the frequency with no problem. As a Ham, I'm always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they're effectively limiting my range.

I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to "enhancement", legal or otherwise. It's become virtually impossible to enforce regulations in all but the most egregious cases. It's much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Thanks and 73,

From: <n7kuw@...>
Topic: 35698 Message: 35714

Very good answer by John Bee N1GNV. However, the 20 mile example should be more like 20 blocks. FRS is really intended as a VERY short range service. As soon as you enable the ability to get more range, you now have the absolute likelihood of causing harmful interference with other FRS users who are not using higher power or external antennas. You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.

So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.

Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

I’m not an FCC lawyer, nor do I play one on TV, but…

I believe the FRS was conceived as a local, “keep in touch with friends”, non-commercial type service. For example, I can be chatting with friends on FRS channel 6 (or whatever). 20 miles away, you can also be chatting with your friends on Channel 6. We’ll never hear each other, and so we can share the frequency with no problem. As a Ham, I’m always thinking about ways to get better range from my radios. To oversimplify, the choices come down to (a) better location; (b) better antenna; or (c) higher power. Not much the FCC can do about location, but by limiting my options for antennas or power they’re effectively limiting my range.

I think the FCC learned from the CB service. Just like Ham Radio, the available equipment lends itself easily to “enhancement”, legal or otherwise. It’s become virtually impossible to enforce regulations in all but the most egregious cases. It’s much easier for them to regulate/enforce standards on a relatively small handful of radio manufacturers.

Carl,

I pity your area if your CERT team is actually trying to use 1/2 watt FRS radios as their main communication system. Surely somebody there has explained that a Tech license is so easy to get now there really is no valid excuse anymore to not have it, haven't they?

If there is ever a large tsunami that hits the northwest (and I pray that doesn't happen), those FRS radios will be as worthless as cell phones on 9/11 in New York City.

They also have licensed hams as well as Part 90 business and public safety licenses. But FRS does in fact serve a purpose, specifically because it is short range. The point is, there is a place for limited range, low power communications.

You can't hear them, but they can hear you. Just like using a CB with an external amplifier. It accomplishes nothing and hurts a lot.

So the rules were designed to intentionally prevent increasing the FRS range. A practical example: The county to my north has a very comprehensive CERT program (Community Emergency Response Team). They have divided the county into various sectors, and each sector is assigned an FRS frequency for their teams to use within that sector. Because of the intentional limited range, they can re-use frequencies a second county away without the teams interfering with each other. That way they can serve 30 some sectors with only 14 FRS channels and have no interference problems.

But, if someone in one of those sectors decides they are going to use the UV-5R with a gain antenna and 4 watts of power out, now they would interfere with the communications two sectors over (possibly in multiple directions) and degrade the overall emergency communications system they designed and implemented.

Those are the reasons behind these particular rules. There are many other licensed radio services available (ham, GMRS, commercial/business, public safety) that permit higher power and longer range. So there is absolutely no problem setting up a longer range radio system, just not using FRS.

0.5 watt ERP no antenna gain.

>The question is, help me understand why it makes a diffeence that
>FRS radios should not be more than 1/2 watt, why do the antennas

Limited to 0.5 watt ERP to limit range and thus reuse the channels.

> frequency, but I don't understand why.

You can use UV-5R on FRS frequencies.

Just not legally.

The radio is capable of operating on those frequencies, but, because the radio does not been the FCC requirements for operation on the FRS frequencies, it is not legal to operate the UV-5R (and its brethren) on the FRS frequencies.

The requirements are there to keep FRS operations short-range, so lots of people can use the same channels and you aren't fighting for air time with someone a thousand miles away.

Using UV-5R with OEM antenna and low power keeps operations within short-range (so you're complying with the 'spirit' of the law, albeit not the 'letter' of it).

All,
I am sure, like others, being an Lic. Am. Radio Op, when We see these FRS and other raidos advbertising "20 miles" range it is interesting, often causing a purchase. I know I did, I have a couple different models including the MicroTalk with tons of channels, codes, ect...

Problem is when you get home and throw it on you really pretty quickly realize that "20 miles' is marketing and under "REAL WORLD" experience it is about 20 feet range, IF THAT -- these are generall made for people that want a Amateur Radio License, but cannot or will not take the time to study for the test.

IMHO they are a waste of money for adults. The Kids like them for room-to-room communication in a House, of Front-yard-to-Back-Yard communications, ect. In this regard they work fine and I think peeks interest in younger minds for better Radio communication -- who couldn't want better one you get he "bug."

One thing is VERY CLEAR your not going to get it with FRS or GRMS without breaking the Law. People always think they will not get caught until a Administrative Fine of $5k comes in the mail (see online for the guy who was told repeatedly to shut down and refused) and then it goes up more and the bank account levies come -- there IS enforcement and like speeding might not get it this time or that time - but keep it up and you will get one. Take the test. Keep legal it is not worth it and you have a sense of accomplishment.

The FRS and other such Radios are for kids, not adults, as they do not work well over any distance -- and you would be better off using CB if you want that type of communication (It worked for truckers for years....still does) as it is Un Lic. (you need only pay the Lic. fee so akin to unlic. in that regard as not test of Knowledge is needed) as much better propagation on CB (10 Meter) radios with 4 watts, than FRS

Thats my two cents and I think anyone trying to use FRS or GMRS (generally I realize exceptions) seriously realizes the junk it is with no power and no antenna improvements -- which is Precisely WHY they are in place - want the real thing take the Amateur Radio test and use Ham, it actually works !!!

For the most part I totally agree with you. I've seen FRS used very well in small business communications (remember ham radio can't be used for business purposes).

GMRS, we use it here all the time to talk 10, 20 and sometimes more. And we use it for event communications some 30+ times a year.

As much as you enjoy being a ham, not everyone wants to be one. My wife is one, GMRS is all she wants. This is true of the average GMRS/FRS user.

Personally I became a ham to supplement my GMRS needs. There are times when we need to cover areas to far apart to be effective using GMRS simplex. At those times bing able to use a ham repeater would be beneficial.

Each service has a need or they wouldn't exist.

Gary N9PTC

Well, not exactly, as even at low power the UV-5R is putting out more than ½ watt. Besides, since when is abiding the spirit of the law all that matters?

We don't see FRS radios "advbertising "20 miles" range". It is the dual service (FRS/GMRS) radios that operate using 4 watts or more as GMRS radios on GMRS frequencies that claim "20 miles".

Being a "Lic. Am. Radio Op," I am familiar with UHF propagation and would never believe such marketing claims.

You would have to really have some very unusual terrain to keep even an FRS radio from operating reliably up to 200 feet. The company I work for used to use FRS/GMRS radios set to an FRS only channel (which forced the radio to operate with 1/2 watt ERP) to communicate between maintenance employees reliably within a 250,000 square foot building.

You did realize that these radios require batteries and that they should be charged first?

These radios are very useful for adults. As I said, these radios were used a my place of work. I use them quite reliably when going to festivals that cover several blocks. It allows us to get separated and still stay in touch.

Most purchases of these radios are likely made by those that have never heard of ham radio. And if they've heard of ham radio, what they think know about it is probably incorrect.

The GMRS service allows repeaters and radios with external antennas. It is entirely feasible to legally achieve 20 miles range with GMRS.

The Amateur Radio Service is different from the General Mobile Radio Service. They have different purposes. You just can't substitute one for the other.

I believe that your perception of FRS/GMRS radios is incorrect. These radios are not toys. And they work quite well for their intended purpose.
